Phosphine-Mediated Cyclopentannulation of Arenes and Heteroarenes

A thesis submitted for the partial fulfillment of the degree of Doctor of Philosophy

by

BISHNUPADA SATPATHI

Department of Chemical Sciences Indian Institute of Science Education and Research (IISER) Mohali Sector 81, Knowledge City, S. A. S. Nagar, Manauli PO, Mohali, 140306. Punjab, India. July 2019

Dedicated to my beloved teacher **Nimai Bhanja**

Declaration

The work presented in this thesis titled "*Phosphine-Mediated Cyclopentannulation of Arenes and Heteroarenes*" has been carried out by me under the supervision of **Dr. Sripada S. V. Rama Sastry** in the Department of Chemical Sciences, Indian Institute of Science Education and Research (IISER) Mohali.

This work has not been submitted in part or full for a degree, diploma, or a fellowship to any other university or institute.

Whenever contributions of others are involved, every effort is made to indicate this clearly with due acknowledgments of collaborative work and discussions. This thesis is a bona fide record of original work done by me and all sources listed within have been detailed in the bibliography.

Bishnupada Satpathi

Date: 6th July 2019 Place: IISER Mohali

In my capacity as the supervisor of the candidate's thesis work, I certify that the above statements by the candidate are true to the best of my knowledge.

Dr. Sripada S. V. Rama Sastry

Associate Professor Department of Chemical Sciences Indian Institute of Science Education and Research Mohali

Date: 6th July 2019 Place: IISER Mohali

Acknowledgements

I am gratefully indebted to my supervisor Dr. Sripada S. V. Rama Sastry, for his inspiring guidance and constant encouragements throughout the present investigations. I am thankful to him for believing in me and allowing me to work in his lab. It was a great journey all together as a Ph.D. student with ups and downs of organic synthesis. It has been a great privilege and honor to be associated with him.

I am thankful to my doctoral committee members Dr. R. Vijaya Anand and Dr. V. Sugumar, for spending their valuable times and offering useful suggestions during the yearly assessment of my thesis work.

It is my privilege to thank present and former directors of IISER Mohali Prof. D. P Sarkar and Prof. N. Sathyamurthy for providing world-class research infrastructures.

I acknowledge NMR, X-ray, and HRMS facilities of IISER Mohali. I want to thank NMR facility committee members Dr. Kavita Dorai, Dr. R. Vijaya Anand, Prof. P. Guptasarma, for their help. I am grateful to Dr. A. R. Choudhury, Prof. Sanjay Mandal for cooperation in recording X-ray analyses of my samples. Next, I sincerely thank HRMS facility committee members Prof. P. Guptasarma and Dr. S. A. Babu. I am grateful to the present and former head of the department Dr. S. A. Babu, Prof. K. S. Viswanathan and other faculty members of Chemical Sciences for facilitating the use of various departmental instruments and their useful suggestions.

I wish to thank Dr. P. Balanarayan and Nitin Kumar Singh for performing the DFT calculations and their valuable suggestions to the mechanistic insights.

It gives me a great pleasure to thank all my former and current lab members Dr. Seema, Rajendra, Sangharatna, Siddheshwar, Manisha, Jopaul, Raghu, Uttam, Atanu, Sonu, Bara, Siddhant, Raju, Lona, Prashant, Kaushalendra, Pinku, Shivangi, Ketan, Jay Prakash, Dipto, Mrudula, Animesh, Dr. Jagdeep, Dr. Vivekanand and Dr. Nitul for maintaining healthy environment and useful discussions in the lab which helped me in learning and understanding various aspects of research. I thank especially to Lona for her contribution to synthesize the starting materials. I also thank all the summer trainees who worked for short time projects in our lab.

It is an excellent privilege to express my sincere regards to all my teachers and lecturers (especially Dr. Dulal Chandra Maiti, Mr. Pinaki Maity, and Mr. Saurav Maity), who taught me

during the entire tenure of my educational carrier. My beloved teacher Mr. Nimai Bhanja, to whom this dissertation is dedicated to, has been an inspiration all these years.

I am thankful to my friends in IISER Mohali especially Dr. Prasanta, Dr. Prithwish, Dr. Dibyendu, Dr. Abhijit, Dr. Prasenjit, Dr. Gouri, Dr. Biswajit, Joydip, Narendra for their heartily support throughout my Ph.D. carrier in IISER Mohali. I wish to thank Dr. Suchand from IIT Hyderabad, Suman from IIT Ropar and Dr. Sibaprasad from NCL Pune for providing the HRMS data and research articles.

I acknowledge the help and support provided by the technical stuff especially Mr. Triveni, Mr. Balbir for their timely help with HRMS and NMR data, and non-teaching stuff especially, Mr. Mangat, Mr. Bahadur and Mr. Satwinder of the department of chemical sciences.

I am grateful to UGC-New Delhi and IISER Mohali for providing my doctoral fellowship.

Finally, I would like to express my heartfelt gratitude to my parents and family members for their unconditional love, support, and encouragements for accomplishing my dream. Every time I was ready to give up, you did not let me, and I am forever grateful. Above all, I would like to thank my best friend Sutapa for her constant support for all the peaks and valleys of this journey.

> **Bishnupada Satpathi** 6th July 2019

Summary

The five-membered carbocycles are recognized as essential class of substructures widely present in natural products and pharmaceutically active molecules. They are often utilized as key building block for the synthesis of complex targets. On the other hand, arene and heteroarene-fused carbocycles are abundant in a diverse range of bioactive natural products and pharmaceutically relevant molecules. Among them, indanes and pentannulated heteroarenes consisting of indole, thiophene, benzothiophene, benzofuran, and furans have occupied a distinct place in pharmaceuticals and found broad application in material science especially in organic semiconducting materials and optoelectronics. The importance of cyclopentanoids inspired the development of numerous synthetic strategies to access pentannulated arenes and heteroarenes by utilizing precious metals and organocatalysts. However, the development of general, efficient, and atom-economic organocatalytic methods starting from the readily accessible materials remain an emerging research area.

The thesis entitled "*Phosphine-Mediated Cyclopentannulations of Arenes and Heteroarenes*" describes the efforts towards the development of novel phosphine-mediated strategies for the pentannulation of arenes and heteroarenes. The content of the thesis has been divided into four sections. In all the sections, a brief introduction is provided, the compounds are sequentially numbered (bold), and references are marked sequentially as superscript and listed at the end of the thesis.

The first section highlights various organophosphine mediated strategies such as [3+2], [4+1], [2+2+1] cycloaddition reactions, Rauhut-Currier (RC) reaction, and Morita-Baylis-Hillman (MBH) reaction leading to a wide variety of cyclopentanoids.

Our ongoing research interest in developing of new organocatalytic strategies for the cyclopenta-fused arenes and heteroarenes, we designed substrates amenable to an intramolecular Morita-Baylis-Hillman (IMBH) reaction by tethering the enone and carbonyl functionalities *ortho* to each other. The second section of the thesis demonstrates an efficient intramolecular MBH reaction of β -mono- and β , β -disubstituted enones. In an attempt to develop an enantioselective IMBH reaction several solvent and catalyst combinations were evaluated. An excellent enantioinduction was realized with the bifunctional phosphine only in hexafluoroisopropanol (HFIP) solvent. A diverse range of cyclopenta[*b*]annulated arenes and heteroarenes synthesized from easily accessible starting materials in excellent yields and short reaction time.

Summary

Continued research interest in developing new strategies for the cyclopentannulation prompted us to design the dienone-aldehyde substrate amenable to an intramolecular MBH (IMBH) reaction. The third section discusses a highly enantioselective IMBH reaction of δ -mono and δ , δ -disubstituted dienones to access cyclopenta-fused arenes and heteroarenes. This work represents the first enantioselective intramolecular MBH reaction of dienones. The reaction mechanism was elucidated through control experiments. Further, the IMBH adducts were elaborated to 3,4-disubstituted fluorenones *via* a one-pot telescopic method.

The fourth section describes a phosphine and water-mediated intramolecular reductive cyclization reaction of α -substituted dienone-aldehydes to afford the highly functionalized cyclopenta-fused arenes and heteroarenes bearing two contiguous stereogenic centers, one of them being an all-carbon quaternary center, in good yields and diastereoselectivities. Interestingly, this result represents the first metal- and hydride free intramolecular reductive aldol reaction of α -substituted dienones. The role of water and mechanistic details were thoroughly elucidated by means of control experiments. After the successful establishment of an intramolecular reductive aldol reaction, a series of serendipitous one-step elaborations of reductive aldol products were established. These strategies describe efficient access to indeno-[1,2-*b*]furanones, indeno[1,2-*b*]pyrans, and dibenzo[*a*,*h*]-azulen-8-ones.

Section 1

General Introduction About Cyclopentanoids

The five-membered carbocycles are recognized as essential class of substructures widely present in natural products and pharmaceutically active molecules. They are often utilized as crucial building block for the synthesis of complex targets. Cyclopentane fused carbocycles also frequently encountered in nature. Polyfunctionalized cyclopentanes exhibit excellent biological activities, such as Ticagrelor is a marketed drug employed for the treatment of platelet aggression inhibitor. Pactamycin shows promising antiviral and anti-tumor activity. Marine secondary metabolite Vannusal B, isolated from *Euplotes vannus*, is an anti-fungal agent, Fig. 1.¹

Figure 1: Natural products and pharmaceutically important molecules possessing cyclopentanes

On the other hand, heteroarene fused cyclopentanes are also abundant in a diverse range of active pharmaceutical ingredients, natural products, and organic materials.² Among them, pentannulated heteroarenes consisting of indole, pyrrole, benzofuran, and furans have occupied a distinct place in organic synthesis. For example, cyclopenta[*b*]indole core containing natural product Polyveoline, an indolosesqiterpene isolated from *Polyalthia suaveolens*, exhibits antiparasitic activity. Spiroindimicin B isolated from marine actinomycete *Streptomyces* shows anticancer activity. The cyclopenta-fused pyrrole macrocycle, Roseophilin isolated from *Streptomyces griscovirides* is an antibiotic and anti-cancer agent. (–) Nakadomarin-A a furan alkaloid shows kinase-4 inhibitory activity and antibacterial activity. An orally active vasodilatory, antiplatelet and cytoprotective agent, prostacyclin analog Beraprost also possess a cyclopenta-fused benzofuran moiety, Fig. 2.³ Furthermore, cyclopenta[*b*]annulated thiophene and benzothiophenes find potential applications in organic semiconductors.⁴

Figure 2: Representative examples of bioactive cyclopenta-fused arenes and heteroarenes

The cyclopentannulated arenes (indane and indene), one of the most important carbocycles, serve as an essential central structure in many natural products. They exhibit diverse biological activities such as antiallergic, antimicrobial, including antitumor, anti-hypercholesterolemic properties, and often found in active pharmaceuticals. For example, the resveratrol derived, Caraphenol B isolated from *Caragana sinica* shows promising anti-fungal activity. Another resveratrol dimer, Pallidol is widely found in red wine with antioxidant activity. A protease inhibitor, Crixivan marketed as an anti-HIV drug also possesses a functionalized indane moiety, Fig. 2.⁵ They are also employed as versatile chiral ligands and organocatalysts in organic synthesis.⁶ Besides, these indanes are useful in material science.⁷

These aforementioned importances of cyclopentanoids in the area of synthetic organic chemistry, pharmaceuticals, and materials science hold the key for the ever-growing interest to develop efficient synthetic protocols. Past few decades, enormous numbers of method have been developed by employing precious metal (Pd, Au, Pt, Ru, Rh, and Ir) catalysis.⁸ Though metals exhibit a high level of selectivity, the major drawback is the toxicity originating from metal contamination in pharmaceuticals. Recently organocatalytic approaches (N-heterocyclic carbenes (NHCs), organophosphines and amines) received remarkable attention due to their operational simplicity, atom economic and less toxic nature. Toward this, various organophosphine mediated strategies such as [3+2], [4+1], [2+2+1] cycloaddition reactions, Rauhut-Currier (RC) reaction, and Morita-Baylis-Hillman (MBH) reaction have been reported.⁹ In the next few subsections, a few important metal-free methods leading to a wide variety of cyclopentanoids are described.

1.1: [3+2] cyclization based approaches for the synthesis of cyclopentanes

In 1995, Lu *et al.*¹⁰ documented an unprecedented intermolecular phosphine catalyzed [3+2] cycloaddition reaction. The reaction of 2,3-butadienoates **1a** or 2-butynoates **1f** with activated alkenes resulted in the formation of highly substituted cyclopentenes **1c** and **1d** in good yields and regioisomeric ratio, albeit small amount of dimerized product of allenoate **1e** also was observed, Scheme 1. This reaction opened a new avenue in the area of phosphine catalysis.

Scheme 1: Lu's [3+2] for the synthesis of cyclopentenes

In 1997, Zhang *et al.*¹¹ reported the first asymmetric Lu [3+2] annulation by employing the rigid-bridged chiral phosphines **2e**, Scheme 2. A wide variety of substituted cyclopentenes **2c** and **2d** were synthesized in good yields and excellent enantio- and regioselectivities. The sterically hindered alkenes influenced the better enantioinduction in the product.

Scheme 2: Zhang's asymmetric cyclopentene synthesis

In 1997, Pyne *et al.*¹² described the synthesis of spirocyclic L-glutamates by employing [3+2] cycloaddition reaction, Scheme 3. A variety of L-glutamate analogs **3c** and **3d** were synthesized in good yields and moderate regioselectivities, owing to their medicinal importance. The cyclic α -amino acids **3e** and **3f** also were achieved *via in-situ* hydrolysis of **3c** and **3d** respectively.

Scheme 3: Pyne's synthesis of spirocyclic L-glutamates

In 2003, Lu *et al.*¹³ first employed activated allyl bromides **4a**, which can be obtained easily from Baylis-Hillman adducts, as C_3 component in a [3+2] cyclization, Scheme 4. The reaction of maleimide **4b** with allyl bromides **4a** furnished the annulated cyclopentenes **4f** in good yields. The initial formation of a phosphonium salt **4c** converts to the corresponding ylide **4d** in the presence of a base and subsequently undergoes the Michael addition and cyclization leading to the desired products.

Scheme 4: Lu's [3+2] annulation of MBHADs

In 2003, Krische *et al.*¹⁴ came up with an intramolecular version to overcome the regioselectivity issue in the formal Lu [3+2] cyclization, Scheme 5. The intramolecularly tethered enone-ynone functionalities of **5a** undergo regioselective cycloaddition reaction *via* a zwitterionic intermediate **5b**, in the presence of tributylphosphine to deliver the diquinanes **5c** in good yields and excellent diastereoselectivities.

Scheme 5: Krische's synthesis of diquinanes

In 2006, Fu *et al.*¹⁵ have demonstrated an asymmetric [3+2] cycloaddition of allene **1a** with chalcones **6a**, Scheme 6. By employing the Gladiali's phosphepine **6d**, an array of densely substituted cyclopentenes **6b** and spirocyclic indanes **6f** were synthesized in excellent yields and enantioselectivities. Later Marinetti *et al.*¹⁶ also described similar cycloaddition reaction by utilizing ferrocene-based chiral phosphine **6g**.

Scheme 6: Fu's and Marinetti's asymmetric cyclopentene synthesis

In 2007, Tang *et al.*¹⁷ have constructed [n.3.0] ring systems *via* an intramolecular ylide annulation, Scheme 7. The Morita-Baylis-Hillman adducts (MBHADs) and activated olefins were tethered intramolecularly to deliver the annulated cyclopentenes 7c in excellent diastereoselectivities, under phosphine catalysis *via* an in situ generation of ylide 7e and subsequent cyclization.

Scheme 7: Tang's intramolecular [3+2] cycloaddition

In 2007, Kwon *et al.*¹⁸ developed an efficient intramolecular [3+2] cycloaddition reaction of 2-styrenyl allenoates **8a**, Scheme 8. The intramolecular cyclization provided cyclopentene fused dihydrocoumarines **8b** in excellent yields and exclusive diastereoselectivities in the presence of tributylphosphine. An exclusive solvent and catalyst dependent reactivity of allenoates **8a** also was observed in this study.

Scheme 8: Kwon's synthesis of cyclopentene fused dihydrocoumarines

In 2009, Shi *et al.*¹⁹ have exploited 2,3,4-pentatrienoates **9a** in the [3+2] cycloaddition reaction as a three carbon synthon, Scheme 9. The reaction between trienoates **9a** and arylmethylidenemalononitriles **9b** generated the cycloadducts **9c** in moderate to excellent yields.

Scheme 9: Shi's synthesis of cyclopentenes using 2,3,4-pentatrienoates

In 2010, Loh *et al.*²⁰ have introduced 3-butynoates **10a** in an asymmetric [3+2] cycloaddition reaction as a C₃ precursor. In the presence of chiral bidentate phosphine **10d** (*R*,*R*-DIPAMP), 3-butynoate **10a** undergoes in situ isomerization to generate the corresponding allenoate. Subsequently, the reaction of allenoates with chalcones **10b** delivered the highly substituted cyclopentenes **10c** in excellent yields and enantioselectivities, Scheme 10. This reaction has an advantage, the exclusive formation of α -addition product can be obtained, unlike Fu's and Marinetti's approach, where the regioisomeric mixture was observed, Scheme 6.

Scheme 10: Loh's asymmetric synthesis of cyclopentenes

In 2011, Lu^{21} and Barbas, III^{22} independently reported an asymmetric intermolecular cycloaddition reaction of methyleneindolinones **11a** with Morita–Baylis–Hillman adducts **11b**, Scheme 11. Lu has introduced an L-threonine derived bifunctional phosphine **11e** for the transformation. The reaction proceeds through an initial zwitterion formation and subsequent Michael addition *via* the transition state **11f** leading to the formation of functionalized spirocyclopentenes **11c** and **11d** in excellent enantioselectivities and regioisomeric ratio. On the other hand, Barbas employed the bidentate chiral phosphine **11g** [(+)-Ph-BPE], to generate the enantioenriched spirocyclopenteneoxindoles.

Scheme 11: Lu's and Barbas' synthesis of enantioselective spirocyclopenteneoxindoles

In 2012, Jorgensen *et al.*²³ demonstrated enantioselective one-pot synthesis of cyclic α amino esters, Scheme 12. (S)-^{*t*}Bu-BINEPINE **12c** mediated [3+2] cycloaddition reaction of olefinic azalactone **12a** with allenoates **1a** generated spiro-lactones, which upon in situ hydrolysis furnished cyclopentenes **12b** in high regio- and enantioselectivities.

Scheme 12: Jorgensen's asymmetric cycloaddition of azalactone

In 2013, for the first time, Shi *et al.*²⁴ utilized 2-methylenebut-3-enoates **13a** as a C_2 synthon in [3+2] cycloaddition reaction with allenoates **13b**, Scheme 13. The bifunctional chiral phosphine **13d** induced moderate enantioselectivity and delivered the cyclopentenes **13c** bearing an all-carbon quaternary stereogenic center in good yields.

Scheme 13: Shi's asymmetric cycloaddition of 2-methylenebut-3-enoates

In 2015, Voituriez and Marinetti *et al.*²⁵ designed a novel class of phosphine possessing helical chirality. They have synthesized a library of chiral phosphahelicene and demonstrated their utilization in different cycloaddition reaction. Various γ -substituted allenoates **14a** with alkylidenemalononitriles **14b** undergo [3+2] cycloaddition reaction smoothly in the presence of phosphahelicene **14d**, leading to densely functionalized cyclopentenes **14c** in excellent diastereo-and enantioselectivities, Scheme 14.

Scheme 14: Marinetti's phosphahelicene mediated asymmetric [3+2] reaction

In 2016, Miao *et al.*²⁶ explored a phosphine mediated one-pot sequential multicomponent [3+2]/[3+2] cycloaddition reaction of ethyl 5-phenylpent-2-ynoate **15e**, substituted aryl ethyl propiolates **15a**, amines **15b**, and carbon disulfide **15c**, Scheme 15. The reaction involves an initial PBu₃ mediated three-component reaction to form rhodanines **15d**, and subsequent cycloaddition reaction with allenoate **15f** (generated from 5-phenylpent-2-ynoate **15e**). A variety of substituted 5-spiro cyclopentene-rhodanines **15g** were synthesized in excellent yields and diastereoselectivities.

Scheme 15: Miao's one-pot multicomponent cycloaddition reaction

In 2017, Zhang *et al.*²⁷ reported a facile asymmetric synthesis of trifluoromethylated cyclopentenes **16c** bearing three contiguous chiral centers by utilizing the bidentate chiral phosphine **16d** *via* [3+2] cycloaddition reaction, Scheme 16. A wide variety of γ -alleonates **16a** and fluoroalkylated enones **16b** were well tolerated under the mild conditions to deliver the desired products **16c** in excellent enantioselectivities and yields.

Scheme 16: Zhang's asymmetric cycloaddition of γ -substituted allenoates

1.1.1: Application of [3+2] cycloaddition reaction in total synthesis

In 2003, Lu *et al.*²⁸ achieved the first total synthesis of (–)-hinesol **17e** by utilizing [3+2] cycloaddition reaction as the key step, Scheme 17. Enantiomerically pure cyclohexenone **17b**, obtained from commercially available cyclohexenone **17a**, was reacted with the *tert*-butyl 2-butynoate **17c** in the presence of tributylphosphine to construct the spirocyclic skeleton **17d**. The natural product (–)-hinesol was accomplished after a few synthetic transformations of **17d**, an overall 22% yield and excellent enantioselectivity were realized.

Scheme 17: Lu's total synthesis of (-)-hinesol

In 2003, Krische *et al.*²⁹ developed an intramolecular [3+2] cycloaddition reaction of a tethered enone-ynone system and applied to the total synthesis of triquinane natural product hirsutene **18d**, Scheme 18. The starting alcohol **18a** was converted to the enone-ynoate **18b** and subjected to the phosphine catalysis to furnish the diquinane **18c** as a single diastereomer. Further synthetic manipulations of **18c** afforded the efficient access of hirsutene **18d**.

Scheme 18: Krische's total synthesis of hirsutene

In 2009, Krische *et al.*³⁰ adopted the Lu's [3+2] cycloaddition reaction for the total synthesis of (+)-geniposide **19d**, Scheme 19. Kinetic resolution of pyranone **19a** using Trost's ligand resulted in the enantiopure pivolate **19b**. The phosphine catalyzed annulation with allenoate **1a** provided the advance intermediate **19c** and was further elaborated to complete the total synthesis of (+)-geniposide **19d**.

Scheme 19: Krische's total synthesis of (+)-geniposide

1.2: [4+1] cyclization based approaches for the synthesis of cyclopentanes

In 2010, Tong *et al.*³¹ demonstrated a novel [4+1] cycloaddition reaction for the synthesis of cyclopentenes, Scheme 20. 2-(Acetoxymethyl)-buta-2,3-dienoates **20a** generate the species **20d** in the presence of triphenylphosphine and serve as a 1,4-bisnucleophilic system. The base mediated generation of **20e** followed a γ -umpolung addition to the diene **20d**. An intramolecular proton shift of ylide **20f** and subsequent cyclization lead to desired cyclopentenes **20c**.

Scheme 20: Tong's [4+1] cycloaddition of 2-(Acetoxymethyl)-buta-2,3-dienoates

In 2013, He *et al.*³² reported another variant of [4+1] cycloaddition by employing activated diene **21a** as a C₄ synthon and Morita-Baylis-Hillman acetate **4a** as a C₁ synthon to generate the functionalized cyclopentenes **21b** in good yields, Scheme 21.

Scheme 21: He's [4+1] cycloaddition of MBHADs

1.3: [2+2+1] cyclization based approaches for the synthesis of cyclopentanes

In 2011, He *et al.*³³ documented an unusual dimerization of chalcones **22b** *via* [2+2+1] cycloaddition reaction, Scheme 22. The initially formed ylide **22d** undergoes sequential Michael addition with two molecules of chalcone to form **22f**, and cyclizes to produce fully substituted cyclopentanes **22c**.

Scheme 22: He's [2+2+1] cycloaddition for fully substituted cyclopentane

In 2014, Miller *et al.*³⁴ presented a phosphine catalyzed cyclization of butynoates and aroylformates, Scheme 23. PCy₃ mediated dimerization of **23a** followed by nucleophilic addition to the aroylformates **23b**, and subsequent rearrangements furnished the cyclopentene fused pyranones **23c**. However, in the presence of methanol, the in situ methanolysis delivered the substituted cyclopentenes **23d** in moderate to good yields.

Scheme 23: Miller's cycloaddition of 2-butynoate and α -keto esters

1.4: Rauhut-Currier (RC) reaction based strategy for cyclopentane synthesis

Rauhut-Currier reaction is a phosphine catalyzed dimerization of acrylonitrile disclosed in 1963.³⁵ This reaction proceeds *via* initial conjugate addition of phosphine to form an enolate and subsequent Michael addition to another activated alkene. Later, McClure reported the first cross-coupling reaction of acrylonitrile with ethyl acrylate albeit in low yields.³⁶ Though few other research groups introduced RC reaction mediated by tert-amines, this was not studied well owing to its inherent lack of stereo- and regioselectivity until 2002. A general representation of the RC reaction is depicted in Scheme 24.

Scheme 24: General representation of RC reaction

In 2002, Krische³⁷ and Roush³⁸ independently described an intramolecular variant of Rauhut-Currier reaction to address the regioselectivity by designing an enone-enone tethered substrate **25a**, Scheme 25. The reaction underwent phosphine mediated chemo- and stereoselective cyclization for both symmetric and unsymmetric bis-enones to generate the desired cyclopentenes **25b** in excellent yields.

Scheme 25: Intramolecular Rauhut-Currier reaction of bis-enones

In 2012, Huang *et al.*³⁹ constructed highly functionalized cyclopentenes **26c** *via* an unconventional Rauhut-Currier domino reaction, Scheme 26. Initial 1,4-phospha Michael addition of dienone **26a** led to intermediate **26d**. Subsequently, **26d** underwent another Michael addition with activated nitrile **26b** to form the 1,5-zwitterionic species **26e**, followed by cyclization to furnish **26c** in excellent diastereoselectivities.

Scheme 26: Huang's Rauhut-Currier domino reaction of dienones

In 2012, Shi *et al.*⁴⁰ presented an intramolecular enantioselective Rauhut-Currier reaction. A multifunctional chiral phosphine **27c** was employed to synthesize the functionalized cyclopentenes and indenes **27b** in excellent enantiopurities from dienones **27a**, Scheme 27.

Scheme 27: Shi's asymmetric cyclopentannulation

1.4.1: Application of Rauhut-Currier reaction in total synthesis

In 2003, a year after the first report on intramolecular Rauhut-Currier reaction, Roush *et al.*⁴¹ exploited this strategy for the total synthesis of antimitotic agent FR182877 **28c**, Scheme 28. An advanced intermediate enone-enoate **28a** was subjected to the phosphine catalysis in a binary medium to deliver the key tricyclic core **28b**, which was further elaborated to **28c**.

Scheme 28: Roush's total synthesis of FR182877

In 2004, Roush *et al.*⁴² described another application of the RC reaction in the stereoselective total synthesis of spinosin A **29c**, Scheme 29. The late-stage cyclopentannulation of **29a** *via* trimethylphosphine mediated RC reaction, and subsequent synthetic maneuvers led to the **29c**.

Scheme 29: Roush's total synthesis of spinosyn A

1.5: Morita-Baylis-Hillman (MBH) reaction based synthesis of cyclopentane

Morita-Baylis-Hillman (MBH) reaction is one of the most synthetically useful carboncarbon bond forming reactions, which involves a reaction between an activated double bond and a carbon electrophile, Scheme 30. In the year 1968, Morita and co-workers⁴³ have reported the reaction between acrylates and various aldehydes in the presence of trialkylphosphine, then in 1972 Baylis and Hillman⁴⁴ described a similar reaction influenced by tertiary amine. In the last few decades, this reaction has received remarkable attention due to its operational simplicity, atom economic, and organocatalytic nature. This method also provides access to a large number of natural products and biologically active molecules.⁴⁵ Several intramolecular MBH reactions are developed for the synthesis of cyclopentanes, Scheme 30.⁴⁶

Scheme 30: General representation of MBH reaction

1.5.1 Conventional MBH reaction based synthesis of cyclopentanes

In 1992, Frater *et al.*⁴⁷ reported the first phosphine mediated intramolecular Morita-Baylis-Hillman reaction (IMBH) of α,β -unsaturated ester-ketone **31a** to access functionalized cyclopentenes **31c**, Scheme 31. An effort to develop the enantioselective IMBH of the substrate **31a** using (–)-CAMP **31d** was successful, albeit in low enantiomeric excess.

Scheme 31: Frater's intramolecular MBH reaction

In 2003, Koo *et al.*⁴⁸ designed ω -formyl- α , β -unsaturated carbonyl compounds **32a** and employed in PPh₃ mediated IMBH reaction to synthesize five-membered carbocycles **32b**, Scheme 32.

Scheme 32: Koo's cyclopentene synthesis *via* IMBH reaction

In 2007, Shi *et al.*⁴⁹ synthesized a library of polystyrene supported bi-functional phosphines **33c**. The application of these phosphines was further investigated by adopting Koo's substrate design **33a**, to achieve cyclopentenes **33b**, Scheme 33.

Scheme 33: Shi's IMBH reaction using polymer-supported phosphine

In 2008, Gladysz *et al.*⁵⁰ developed thermomorphic fluorous phosphine **34c** for IMBH reaction, Scheme 34. The easy recoverability of the catalyst makes this method advantageous over other existing methods. Eventually, an asymmetric version was also developed by using the chiral Rhenium-containing phosphine **34d** and synthesized cyclopentenes **34b** in excellent yields and moderate enantiopurities.⁵¹

Scheme 34: Gladysz's rhenium-phosphine mediated IMBH reaction

In 2013, Miesch *et al.*⁵² described a solvent dependent IMBH reaction of activated olefins tethered to cycloalkanones **35a**, Scheme 35. Under microwave condition, wide varieties of bisquinanes **35b** were synthesized by using PBu₃ in excellent yields and diastereoselectivities in very short reaction times.

Scheme 35: Miesch's synthesis diquinanes

1.5.2 MBH alkylation based synthesis of cyclopentanes

In 2003, Krische *et al.*⁵³ demonstrated phosphine-palladium co-operative catalysis for carbocycles generation from the allyl carbonate **36a**, Scheme 36. The reaction involves an initial phosphine mediated enolate formation and subsequent reaction with electrophilic allyl-palladium species *via* the intermediate **36c**. This reaction represents the first example of a unique electrophilic system (generated from allyl carbonate *via* Tsuji-Trost reaction) employed in Morita-Baylis-Hillman reaction.

Scheme 36: Krische's intramolecular co-operative catalysis

In 2005, Krafft⁵⁴ modified the Krische's carbonate **36a** (Scheme 36) by installing allylic leaving groups (such as, -Cl, -OH, -OMs, -OTs) to develop an entirely organophosphine mediated cyclization, Scheme 37. However, only allyl chloride tethered enone **37a** was successful under the optimized condition to generate the cycloalkenes **37b**.

Scheme 37: Krafft's organocatalytic IMBH alkylation

In 2005, Krafft *et al.*⁵⁵ further developed an unprecedented sp³ hybridized electrophilic system for MBH type alkylation, Scheme 38. A wide range of alkyl halides and enones **38a** were tolerated under the optimized condition to furnish cyclopentenes and indenes **38b**. The isolation of the intermediate **38c** further corroborates the MBH reaction pathway.

Scheme 38: Kraft's IMBH alkylation of alkyl halides

In 2006, Krafft *et al.*⁵⁶ introduced epoxide as an electrophile in IMBH reaction, Scheme 39. The enone-epoxide **39a** under phosphine catalysis resulted in homologous IMBH product **39b** in excellent yields through a chair-type transition state **39d**.

Scheme 39: Krafft's IMBH reaction of enone-epoxide

Despite tremendous advancements in organophosphine catalysis, these strategies described above and brief literature survey revealed that most of the methods are limited to the synthesis of cyclopentane analogs. The lack of efficient processes for the synthesis of cyclopentannulated arenes and heteroarenes has encouraged us to envision new advancement in organophosphine chemistry.
Section 2

Synthesis of Cyclopenta[b]annulated Arenes and Heteroarenes via an Enantioselective Intramolecular MBH Reaction of Enones

During the past few decades, the increasing health and environmental issues have raised tremendous global concerns and evolved into the consideration of "Green and Sustainable development" in the chemical synthesis. Towards this, the utmost importance of synthetic organic chemistry is to accomplish the desired complex molecules in short, stereoselective, eco-compatible, and atom-economic manner. This goal could be achieved one way by designing the reactions to perform under organocatalysis instead of toxic metals, as nature utilizes this strategy to synthesize the complex architectures for billions of years. The organocatalysis is often referred to as catalysis with organic molecules, and has received tremendous attention from the synthetic community due to easy handling, simple storage and most often moisture insensitive

conditions.⁵⁷ In recent years, organocatalysis has widened in many different directions. Among them, N-heterocyclic carbenes (NHCs),⁵⁸ amines,⁵⁹ chiral Brønsted acids,⁶⁰ and organo-phosphines are most often employed in catalysis.⁶¹

Organophosphines have attracted considerable attention from the synthetic community. While the phosphine ligands have found wide applications in transition metal catalysis, the use of nucleophilic phosphines as organocatalysis was limited. The history of nucleophilic organophosphine catalysis can be traced back to Price's report of the triphenylphosphine catalyzed hexamerization of acrylonitrile in 1962,⁶² and tributylphosphine mediated dimerization of acrylates by Rauhut and Currier in 1963.³⁵ A few years later, Morita and co-workers have reported trialkylphosphine mediated reaction of activated olefins with various aldehydes to generate β -hydroxy carbonyls, now known as Morita-Baylis-Hillman (MBH) reaction.⁴³ The nucleophilic phosphine has numerous features such as (i) substitution based reactivity, steric and electronic properties, (ii) easily tuneable properties of chiral phosphines and, (iii) highly atomeconomical and metal free. Consequently, in the last two decades, a myriad of fascinating methodologies have been developed for the synthesis of fused carbocycles.⁶³

The MBH reaction is one of the important C-C bond-forming reactions, leading to the formation of densely functionalized molecules in an atom economic and metal-free manner. The Morita-Baylis-Hillman adducts (MBHADs) bearing different functional groups nearby are often manipulated and utilized in the synthesis of natural products and pharmaceutically active compounds.⁶⁴ Surprisingly, this reaction gained momentum only after the landmark report of Frater's intramolecular asymmetric version to synthesize five- and six-membered carbocycles, though in poor enantioselectivities.⁴⁷ Subsequently, several research groups have designed numerous substrates for the IMBH reaction to access various carbocycles and heterocycles in high enantiopurities by employing chiral amines and phosphines.⁶⁵ More than three thousand publications in the last three decades signify the broad applicability of this reaction in organic synthesis.

Despite tremendous advancements in the area of MBH reaction, there remain few unresolved challenges such as (i) reactivity depends on the steric and electronic nature of the reactants, Lewis bases and eventually results in low yields, and (ii) in several instances the reaction proceeds sluggishly due to the presence of β -substitution to afford the desired product. In most of the MBH reactions, β -unsubstituted electron deficient olefins were employed,

whereas only a few β -monosubstituted systems have been achieved successfully. The significant obstruction associated with the β , β -disubstituted- α , β -unsaturated electron-withdrawing systems are highly sterically and electronically demanding. As a result, no successful general method was established even with entropically beneficial intramolecular MBH reaction, Scheme 40.

Scheme 40: General representation of intermolecular MBH reaction

The development of general and efficient protocols to synthesize the highly functionalized annulated cyclopentanes remains challenging. Most often, they are assembled in a multi-step manner due to lack of efficient annulation strategy. As our current research focuses on the efficient synthesis of fused cyclopentanes owing to their importance in natural products and pharmaceuticals, we intended to develop an organocatalytic annulation strategy. The absence of an intramolecular Morita-Baylis-Hillman (IMBH) reaction based approach to access highly enantioselective cyclopent[b]annulated arenes or heteroarenes prompted us to design a substrate amenable to IMBH reaction. Only limited strategies are available for the synthesis of cyclopentanes, Scheme 41.⁴⁶

Scheme 41: IMBH based strategies to access cyclopentanes

To address the above challenges, substrate **42** was designed as depicted in Scheme 42.⁶⁶ Few crucial aspects were considered regarding the substrate design before performing the IMBH reaction. It was envisioned that (i) an intramolecular variant could overcome the high energy activation associated with sterically and electronically demanding β , β -substituents, and (ii)

placing the electron withdrawing enone and carbonyl *ortho* to each other could assert mutually beneficial driving force to facilitate the Michael addition of Lewis base.

R¹ = alkyl, aryl, heteroaryl; R² = R³ = H, alkyl, aryl

Scheme 42: Our design for the synthesis of cyclopenta[b]annulated arenes or heteroarenes

2.1: Results and Discussion

With the desire to access the cyclopent[*b*]annulated arenes and heteroarenes *via* IMBH reaction, we have initiated studies to synthesize the proposed starting material **42** bearing enone and aldehyde moiety *ortho* to each other, Scheme 42. Modular access of the enone-aldehyde **42a** can be easily achieved from the 3-benzothiophene carboxaldehyde **44a**, following a two steps method developed by our research group.⁶⁷

The in situ masking of aldehyde functionality in 3-benzothiophene carboxaldehyde **44a** by lithium N-methylpiperazide (generated from NMP and *n*-BuLi) and subsequent C-2 (α -lithiation) alkylation with commercially available 2-hexenal **47a** led to the formation of enol **46a**, Scheme 43. Further, IBX mediated oxidation of alcohol **46a** furnished the desired enone-aldehyde **42a** in good yield.

Scheme 43: Synthesis of enone-aldehyde 42a by following our earlier report

Table 1: Optimization of the reaction parameters for the IMBH reaction of 42a

All reactions were done on 0.1 mmol scales in 1 mL of solvent. ^{*a*} Isolated yields after silica gel column chromatography. ^{*b*} Determined by ¹H-NMR analysis of the crude reaction mixture.

We have commenced the optimization study by choosing 2-hexenoyl benzothiophene-3carboxaldehyde 42a as a model substrate. A wide variety of nucleophilic triggers and solvents combinations were tested, and the results are compiled in Table 1. The commonly employed amine based Lewis bases (DBU, DABCO, DMAP, and Imidazole) found to be effective to deliver the desired product 43a in good yields (Table 1, entries 1-5).

Enantioselective IMBH reaction of enones

The structure of annulated benzothiophene **43a** was carefully deduced from the IR, NMR, and HRMS data. The presence of a broad absorption band at 3386 cm⁻¹ due to secondary alcohol and a sharp band at 1688 cm⁻¹ due to the unsaturated cyclic ketone in the IR spectrum indicated the formation of IMBH product **43a**. In the ¹H-NMR spectrum (see Fig. 3) presence of a singlet a δ 5.87 ppm due to the C-1 methine proton, a triplet at δ 6.84 ppm due to the β -proton (C-3), and in ¹³C-NMR spectrum (see Fig. 4), presence of a peak at δ 184.8 ppm due to unsaturated ketone (C-2) and a peak at δ 66.7 ppm due to methine carbon (C-1), confirmed the formation of **43a**. The presence of a dehydroxylated molecular ion peak at *m/z* 241.0657 (M-OH)⁺ further supports the product formation.

To further improve the efficiency of the reaction, organophosphines were investigated. Gratifyingly, phosphines bearing an alkyl group (PPh₂Et, PPhMe₂, and PCy₃) displayed a pronounced improvement in the yield and reaction time, whereas triphenylphosphine was not successful in delivering the desired product even after a prolonged reaction time (Table 1, entries 6-9). To our delight, trimethylphosphine requires only a few minutes for generating the product **43a** in excellent yield and stereoselectivity (Table 1, entry 10). Though a brief solvent screening was undertaken, no significant increment was observed concerning yield and reaction time (Table 1, entries 11-15). However, this prompted us to replace volatile dichloromethane with toluene for further studies (Table 1, entry 11).

Scheme 44: Synthesis of thiophene and benzothiophene based enones 42

With the optimal reaction condition in hand, we next focused on evaluating the substrate scope. Towards this, a diverse range of β -monosubstituted and β , β -disubstituted enones appended to aryl, and heteroaryl backbones were synthesized. Thiophene and benzothiophene

based substrates were accessed by following two-step protocol, Scheme 44. Direct α -alkylation of thiophene- and benzothiophene-3-carboxaldehydes 44 with different enals 47 afforded the enols 46 which upon IBX oxidation delivered the enone-aldehydes 42b-42f and 42w-42aa. On the other hand, the enone-ketones 42ap can be synthesized from alcohols 46 *via* Grignard reaction and oxidation sequence, Scheme 44.

On the other hand, substrates bearing different aryl and pyridyl backbones could be achieved in a three-step protocol, Scheme 45. The commercially available 2-bromo-aldehydes **49** were treated with sodium borohydride or an appropriate Grignard reagent to obtain the 2-bromo alcohols **50**. Direct *n*-butyllithium mediated metal-halogen exchange of alcohol **50** followed by alkylation with an appropriate enal **47** generated the diols **51**.⁶⁸ IBX oxidation of the diols **51** led to the formation of the enone-aldehydes **42**.

Scheme 45: Synthesis of aryl and pyridyl based substrates 42

Enals are valuable synthons often utilized in the organic synthesis for generating the complex and diverse molecular architectures. Enals **47** can be obtained from commercially available aldehydes or ketones **52**, Scheme 46. The reaction follows an initial Horner-Wadsworth-Emmons reaction, DIBAL-H reduction and IBX mediated oxidation sequence.⁶⁹

Scheme 46: Synthesis of enals 47

Enantioselective IMBH reaction of enones

A wide range of β -monosubstituted enone-aldehydes was subjected to the optimized condition, Table 2. The intramolecular MBH reaction was realized to be general and efficient, and a diverse range of cyclopent[b]annulated arenes and heteroarenes could be accessed in excellent yields and stereoselectivities. The β -alkyl and β -aryl substituted enones appended to benzothiophene 42b-42c, and thiophene-3-carboxaldehydes 42d-42f delivered the annulated cyclopentanes 43b-43f in excellent yields and short reaction time, Table 2. To our delight, functionalized pyrindanone 42g also was achieved in excellent yields. To further extend our strategy, substituted indanone derivatives **43h-43s** also were assembled successfully in excellent yields within few minutes, Table 2. Regarding the β -substitution, substrates with alkyl, aryl, and heteroaryl substitutions are well tolerated under the optimized condition. The presence of an electron donating group (such as -Me, -OMe) either at β-position of enones 42l or on aryl backbones 42n-42r has no significant influence on the reaction efficiency, Table 2. The fluorinated compounds are known to exhibit unique biological properties. Therefore, fluorinated indanone 43s also was accessed by this method in excellent yield, Table 2. Predicted E-geometry of the major isomer was confirmed by the single crystal X-ray diffraction analysis of indanone 43k and assigned to other products in analogy, Fig. 5.

Figure 5: ORTEP diagram of racemic indanone 43k

The stereoselective formation of E isomer of the intramolecular Morita-Baylis-Hillman reaction can be explained *via* the formation of zwitterionic intermediate **A**, generated by the conjugate addition of phosphine to the enone-aldehyde **42** (Scheme 47). Subsequent intramolecular addol reaction and dephosphorylation delivered **43** as a major product.

Table 2: Substrate Scope: β-monosubstituted enone-aldehydes

All reactions were done on 0.1 mmol scales. Yields were calculated after silica gel column chromatography. E/Z ratio was determined by ¹H-NMR analysis of the crude reaction mixture.

While aldehydes are well documented as electrophiles in the MBH reaction, the use of ketones is limited due to their very poor electrophilic nature. Towards that, we have synthesized few substrates 42t-42v by tethering the β -monosubstituted enone and ketones in *ortho* to each other and treated under the optimized condition, Table 3. To our delight, the reaction efficiently generated the indanones 43t, 43u and pyrindanone 43v bearing a tetrasubstituted carbon in excellent yields and in very short reaction times, Table 3. Thus, compounds with poor electrophiles such as ketones proved to be excellent substrates under the reaction condition.

After realizing the efficient and facile transformation of β -monosubstituted enones appended to aryl and heteroaryl aldehydes or ketones, we considered investigating the previously unexplored β , β -disubstituted enone substrates. Accordingly, various electronically diverse enones-aldehydes **42w-am** were synthesized and subjected to the optimized reaction condition Table 4.

Table 3: Substrate scope: β-monosubstituted enone-ketones

The results are summarized in Table 4. Thiophene and benzothiophene based substrates **42w-42aa** efficiently generated the cyclopent[*b*]annulated products **43w-43aa** in short turnaround time and excellent yields. The β , β -disubstituted pyrindanones **43ab-43ae** were also accessed in significantly short reaction time and high stereoselectivity, Table 4. These results highlight the role of an electron deficient pyridine backbone on the reaction rate enhancement. Difficult to access substituted cycloalkylidene, alkylidene, and arylidene indanones **43af-43am** could also be readily assembled by this method, Table 4. Interestingly, the presence of electron donating groups (such as –Me, –OMe) on aryl backbone **42ak-42al** does not have a significant influence on the reaction efficiency and delivered respective indanones **43ak-43al** in excellent yields, Table 4.

Table 4: Substrate Scope: β,β-disubstituted enone-aldehydes/ketones

Enantioselective IMBH reaction of enones

All reactions were done on 0.1 mmol scales. Yields were calculated after silica gel column chromatography. E/Z ratio was calculated by ¹H-NMR analysis of the crude reaction mixture.

The versatility of this method was further demonstrated by utilizing the substrates possessing poor electrophiles such as ketones. A diverse range of synthetically challenging alkylidene indanones **43an-43ao**, pyrindanones **43aq** and cyclopent[*b*]annulated benzothiophene **43ap** bearing a tetrasubstituted carbon were achieved efficiently in excellent yields under these conditions, Table 4.

2.2: Development of an enantioselective IMBH reaction

After achieving a practical, general and highly efficient IMBH reaction for the synthesis of unprecedented cyclopenta[*b*]annulated arenes and heteroarenes from β -mono- and β , β disubstituted enones, we focused on developing an asymmetric organocatalytic version. Despite significant advancements in the area of asymmetric nucleophilic organocatalysis, only a handful of enantioselective IMBH reactions are reported so far.⁷⁰ Towards this, we have initiated the study with **42k** as a model substrate, Table 5. Various catalyst, ligand and solvent combinations were evaluated. The initial trials with cinchona alkaloids such as β -isocupreidine **C1** (β -ICD)⁷¹

and quinidine C2 were failed to promote the IMBH reaction. Further, Jacobsen's bifunctional amine-thiourea catalyst C3 also was unsuccessful.⁷² However, a combination of chiral amine ligands C4-C7 with different nucleophiles successfully delivered the desired product 43k but in very poor enantioselectivities. A similar effort with chiral phosphoric acid C8 was also discouraging as it led to no enantioinduction.

All reactions were performed on 0.1 mmol scales at room temperature by using 1.0 mL solvent.^{*a*} Reactions were done using toluene and DCM as a solvent. ^{*b*} Nucleophile (10 mol%) and chiral ligand (12 mol%) were used.

Schaus' pioneering report⁷³ on intermolecular asymmetric MBH reaction with chiral Brønsted acids inspired us to employ the BINOL derivatives. The reaction of **42k** in the presence of tricyclohexylphosphine and BINOL **C9** afforded the MBH product in 21% enantiomeric excess (Table 6, entry 1). Unfortunately, no further improvement in enantioselectivity was realized by varying the solvent and nucleophile (DABCO, Me₂PPh) combinations (Table 6, entries 2-3). Prompted by Aggarwal's study⁷⁴ on Lewis acid accelerated MBH reaction, we have evaluated a variety of metal triflates. The use of Lewis acids with (*R*)-BINOL **C9** and (*R*)-BINAP **C10** in the presence of nucleophilic phosphines (PCy₃, PMe₃, Me₂PPh and EtPPh₂) also failed to enhance the enantioselectivity (Table 6, entries 4-11).

In recent years, functionalized amino acids are utilized widely as catalysts in enantioselective reactions.⁷⁵ Miller and co-workers have reported an intramolecular asymmetric Rauhut-Currier reaction by using protected cysteine.⁷⁶ Herein, we have synthesized two cysteine derivatives **C11** and **C12** by following the Miller's protocol. Under Miller's prototypical condition, the IMBH product was obtained in good yields in few minutes but with poor enantiopurities (Table 6, entries 12-14).

Table 6: Screening of chiral catalysts

All reactions were performed on 0.1 mmol scales at room temperature by using 1.0 mL solvent. ^{*a*} Lewis acid (12 mol%), BINAP or BINOL (12 mol%) and substrate were stirred at rt for 1 h in an appropriate solvent, then a nucleophile (10 mol%) was introduced.

Further, phosphepine⁷⁷ based bifunctional catalysts **C13-C15** have been tested in different solvents, but no product was observed even after prolonged reaction time, Table 7. Bidentate phosphines **C16-C19** also failed to deliver a trace of the product in dichloromethane and toluene. Recent advancements in the dramatic influence of fluorinated alcohols in cooperative catalysis by enhancing the H-bonding stimulated us to consider the fluorinated solvents.⁷⁸ Therefore, phosphines **C13-C19** were investigated using 2,2,2-trifluoroethanol (TFE), trifluorotoluene (TFT) and 1,1,1,3,3,3-hexafluoroisopropanol (HFIP). Surprisingly, bidentate phosphine **C17** and **C19** afforded the desired product **43k** only in HFIP with 19% and 43% *ee* respectively, Table 7. With the initial success in HFIP, we have verified the outcome of a different class of bifunctional catalysts **C20-C23**. Interestingly, no product could be observed

with any of the phosphines C20-C23 in toluene, dichloromethane or even in the fluorinated solvents such as TFE or TFT. To our delight, the bifunctional thiourea C23 offered the desired IMBH product 43k in 98% enantiomeric excess and 95% yield *only* in HFIP solvent, Table 7. This result suggests an extraordinary synergism between the substrate 42k, HFIP and bifunctional catalyst C23.

Table 7: Screening of chiral phosphine catalysts

All reactions were performed on 0.1 mmol scales by using toluene (1.0 mL), DCM (1.0 mL), trifluorotoluene (TFT, 1.0 mL), trifluoroethanol (TFE, 1.0 mL) and hexafluoroisopropanol (HFIP, 0.5 mL) as solvent at room temperature and isolated by using silica gel column chromatography.

With the optimized reaction condition in hand, various β -monosubstituted enonealdehydes have been evaluated, Table 8. The β -alkyl and aryl substituted thiophene and benzothiophene-3-carboxaldehydes **42c-42f** generated respective cyclopentannulated products **43c-43f** in excellent yields and enantioselectivities. Pyrindanone **43g** and indanones (**43i-j**, **43l-43m**, **43q-43s**) could also be accessed in high enantiopurities and near quantitative yields. This protocol found to be efficient even with the substrates **43l**, **43q** and **43r** bearing electron donating groups (such as -Me, -OMe) either at the β -position of the enones or on aryl backbone. The β , β disubstituted enones were also very promising under the optimized condition. For example, cyclopenta[*b*]thiophene **43y** and indanone **43af** were achieved in good yields and enantiopurities. Strikingly, electron deficient pyridine **42ab** delivered the pyrindanone **43ab** only in six hours in 91% yield and 85% enantioselectivity.

The absolute stereochemistry of 43k was realized to be (*S*) by comparing the optical rotation with literature data⁷⁹ and was further supported by X-ray diffraction analysis (see Fig. 7). The absolute stereochemistry was assigned to other products by analogy. Accordingly, a proposed transition state is depicted in Fig. 6, which explains the experimental observation.

Figure 6: Proposed transition state for the asymmetric IMBH reaction

Figure 7: ORTEP diagram of chiral indanone 43k

Table 8: Substrate scope: Enantioselective IMBH reaction

All reactions were performed on 0.1 mmol scales. E/Z ratio was determined by analyzing the ¹H-NMR of the crude reaction mixture. *ee* was determined by HPLC using chiral column. ^{*a*} Yield based on starting material recovery. ^{*b*} Reaction was performed at 10 °C.

Though the exact role of the hexafluoroisopropanol was not clearly understood at this stage, it could be attributed to its acidity (PK_a ca. 9.3) in the enhancement of hydrogen bonding. A brief DFT calculation by using B3LYP/6-31+G* basis set further supported our hypothesis.⁸⁰ The catalyst **C23** has been modified to fit within the optimum computational time, without the loss of relevant physical effects. The modification was such that the two phenyl groups of phosphorus and 3,5-trifluoromethyl-benzene of thiourea in **C23** are replaced with hydrogen

atoms. The reactant was chosen to be one with $R^1 = Me$ and $R^2 = R^3 = H$, Scheme 47. The supramolecular assembly between the substrate **42**' and thiourea phosphine **C23**' in the presence of hexafluoroisopropanol *via* hydrogen bonding (as shown in Scheme 48; T1, T2, T3, and T4) could be the crucial driving force for the extremely facile transformation and excellent enantioinduction.

Scheme 48: Proposed transition state on the basis of DFT calculations

In conclusion, we have demonstrated the first asymmetric organocatalytic MBH reaction of β -mono- and β , β -disubstituted enones. A diverse range of enantiomerically enriched cyclopenta[*b*]annulated arenes and heteroarenes were synthesized from easily accessible starting materials in excellent yields and short reaction time. An extraordinary level of synergism was observed among the substrate, catalyst and fluorinated solvent in the MBH reaction.

Section 3

An Enantioselective Intramolecular MBH Reaction of Dienones

The successful development of an efficient and practical enantioselective intramolecular Morita-Baylis-Hillman reaction of (described in section 2) inspired us to envision the reaction of dienones **58**, Scheme 54. Despite significant advancements in the area of MBH reaction, only a handful of successful studies have been realized with activated dienes.

Towards this, in 2005, Radha Krishna *et al.*⁸¹ described a novel protocol for the generation of β -branched MBH adducts by employing commercially available ethyl sorbate **51a** as a Michael acceptor in the presence of DABCO, Scheme 49. The scope of the reaction was further expanded with a variety of aromatic aldehydes under the optimized condition, and adducts **51c** were accessed in good yields and stereoselectivities. Though the reaction is limited

to the use of only electron-deficient aromatic aldehydes and a stoichiometric amount of nucleophilic trigger, it opened a new avenue in the area of MBH reaction of activated dienes.

Scheme 49: Intermolecular MBH reaction of ethyl sorbate

In 2007, Back *et al.*⁸² have reported an *aza*-MBH reaction of activated 1,3-dienes 52a, Scheme 50. Several dienes proceeded smoothly in the presence of 3-hydroxyquinuclidine **52e** to efficiently deliver the functionalized allylic amines **52c**. The MBH adducts obtained from the dienyl sulfone and dienoates were further elaborated to corresponding piperidine derivatives **52d** in excellent yields *via* a base mediated intramolecular 1,6-addition reaction.

Scheme 50: Back's intermolecular aza-MBH reaction of activated dienes

In 2009, Marinetti *et al.*⁸³ developed an efficient method for the practical and scalable synthesis 2,3,5-trisubstituted 3-pyrrolines **53d**, Scheme 51. In the presence of nucleophilic phosphine, the doubly activated dienes **53a** underwent intermolecular *aza*-MBH reaction with a variety of aldimines **53b** to generate the zwitterionic intermediate **53c**. The subsequent *aza*-Michael addition afforded 3-pyrrolines **53d** in excellent yields and diastereoselectivities.

Scheme 51: Marinetti's synthesis of 3-pyrrolines

In 2012, Marinetti *et al.*⁸⁴ reported a tributylphosphine and water-mediated domino *aza*-MBH/reduction process of conjugated dienes, Scheme 52. This reaction involves in an initial vinylogous *aza*-MBH reaction of the vinyl substituted coumarins **54a** with aldimines **54b** and lead to the formation of zwitterion **54c**. Subsequently, zwitterion **54c** undergoes water-mediated hydrolysis either directly, or *via* the corresponding phosphorus ylide **54d** by eliminating phosphine oxide to afford the reduced product **54e** in good yields. The highly stereoselective generation of the reductive products bearing two contiguous stereogenic carbon centers signifies the potential utility of the reductive *aza*-MBH reaction.

Scheme 52: Marinetti's intermolecular reductive aza-MBH reaction

In 2016, Kawabata *et al.*⁸⁵ disclosed a catalyst and solvent controlled regiodivergent *aza*-MBH reaction, Scheme 53. The 3-vinylcyclopent-2-en-1-one **55a** was found to deliver the γ -adduct **55c** preferentially in the presence of stoichiometric DMAP in chloroform. Whereas in the presence of a polar solvent such as methanol, DABCO promoted reaction exclusively to afford the α - adduct **55d** in excellent yields.

Scheme 53: Kawabata's regiodivergent aza-MBH reaction

In 2016, Chittimalla *et al.*⁸⁶ employed masked *ortho*-benzoquinone derivatives as activated diene partner in the MBH reaction, Scheme 54. A diverse range of *o*-quinones **56a**, aldehydes and ketones **56b** were well-tolerated under amine catalysis (DABCO or DBU), and furnished the MBH adducts **56c** in excellent yields.

Enantioselective IMBH reaction of dienones

Scheme 54: Intermolecular MBH reaction of o-benzoquinones

The aforementioned literature survey revealed few unaddressed challenges associated with the MBH reaction of activated dienes: (i) no intramolecular reaction was established, (ii) no report on an asymmetric variant of either inter- or intramolecular reaction, and (iii) activated dienes possessing δ , δ - or β , δ -substitutions (Fig. 12) are unexplored.

Figure 12: Substrate designs for intermolecular MBH reaction of activated dienes

It was envisaged that the dienone **58** could undergo 1,6-conjugate addition of phosphine to generate the zwitterionic intermediate **59**. A Subsequent intramolecular addol reaction of **59** can either lead to the formation of fused-cycloheptenones **60** *via* path a (γ -adduct) or fusedcyclopentenones **61** *via* path b (α -adduct), Scheme 55. Alternatively, the zwitterion **62** formed *via* an initial 1,4-phosphine addition can also lead to fused-cyclopentenones **61** *via* path c.

Scheme 55: Our hypothesis for the IMBH reaction of dienones 58

3.1: Results and Discussion

In order to validate the hypothesis presented in the Scheme 54, we commenced synthesizing the substrate **58a**, Scheme 56. The substituted dienone-aldehyde **58a** can be achieved readily in a two-step protocol starting from 2-bromo benzyl alcohol **50a**. Direct *n*-butyllithium mediated alkylation of **50a** with commercially available 2,4-hexadienal **63a** generated the diol **64a**, and subsequent IBX oxidation furnished the enone-aldehyde **58a**.

Scheme 56: Synthesis of dienone-aldehyde 58a

Accordingly, we have initiated the optimization study with dienone-aldehyde **58a** as the model substrate. Prompted by our earlier success on intramolecular MBH reaction of enones (described in section 2), we have applied the prototypical condition during the initial screening. Strikingly, the dienone **58a** exclusively delivered the indanone **61a** in excellent yield in a 3:1 stereoisomeric ratio within 15 minutes (Table 9, entry 1).⁸⁷ However, even a trace of the expected arene fused-cycloheptenone **60a** was not observed. The other P-centered nucleophiles, except triphenylphosphine, were able to furnish the desired product, but were not encouraging (Table 9, entries 2-6). Typical amine-based Lewis bases also deliver discouring results (Table 9, entries 7-9).

The structure of indanone **61a** was deduced from the spectral data. The presence of two absorption bands in the IR spectrum at 3382 cm⁻¹ due to secondary alcohol and at 1687 cm⁻¹ due to the α,β -unsaturated ketone indicated the formation of **61a**. In the ¹H-NMR spectrum (see Fig. 14), the presence of a doublet at δ 5.73 ppm (J = 9.5 Hz) due to the methine proton (C-1), a doublet at δ 2.25 ppm (J = 9.6 Hz) due to -OH proton, and a doublet of doublet at δ 2.00 ppm (J = 7.0 and 0.8 Hz) due to methyl group confirmed the formation of **61a**. In the ¹³C-NMR spectrum (see Fig 15), a signal at δ 192.1 ppm due to the unsaturated carbonyl (C-2), and a signal at δ 69.0 ppm due to the methine carbon (C-1) further established the structure **61a**. In the high-resolution mass spectrum presence of a dehydroxylated molecular ion peak at m/z 183.0821 (M-OH)⁺ further supported the product formation. The X-ray diffraction analysis of **61a** (Fig.

13) confirmed the predicted *E*-geometry of the major isomer across the diene of the IMBH adducts.

All reactions were performed on a 0.1 mmol scale. ^{*a*} Yield was calculated after silica gel column chromatography. ^{*b*} E/Z ratio was determined by ¹H-NMR analysis of the crude reaction mixture. ^{*c*} Yield was calculated based on the recovered starting material. NR = no reaction.

Figure 13: ORTEP diagram of indanone 61a

Figure 15: ¹³C-NMR spectrum of indanone 61a

After realizing a facile transformation of the dienone-aldehyde **58a** under the optimized condition, we sought to expand the substrate scope. Towards this, electronically diverse dienones were synthesized. Substrates bearing different aryl and pyridyl backbones can be synthesized in a three-step protocol, Scheme 57. The commercially available 2-bromo-aldehydes **49** were converted to the alcohol **50** by treating with either sodium borohydride or phenyl magnesium bromide reagent. Direct *n*-butyllithium mediated metal-halogen exchange of alcohol **50** followed by alkylation with an appropriate dienal **63** generated the diols **64**. IBX oxidation of the diols **64** led to the formation of the dienones **58**.

Scheme 57: Synthesis of substituted dienone-aldehydes 58

Substrates bearing a non-aromatic backbone **58j** and **58v** also can be readily synthesized, Scheme 58. The bromo-aldehyde **65** was synthesized based on literature procedure from 4chromanone,⁸⁸ and subjected to the borohydride reduction. The desired dienones were achieved *via n*-butyllithium mediated alkylation and IBX oxidation sequences of the bromo-alcohol **66**.

Scheme 58: Synthesis of chromene based dienone-aldehydes 58j and 58v

Thiophene and benzothiophene based dienone-aldehydes **58k** and **58l** can be accessed in a two-step protocol, Scheme 59. Directed α -alkylation of thiophene- and benzothiophene-3carboxaldehydes **44** with 2,4-hexa-dienal **63a** afforded the dienols **69**, which upon IBX oxidation generates the dienone-aldehydes **58k** and **58l**. Alternatively, the dienone-ketone **58o** can be accessed from **69** *via* methyl magnesium bromide addition and oxidation sequence.

Scheme 59: Synthesis of thiophene and benzothiophene based dienones 58k, 58l and 58o

The substituted dienals **63** employed in this study can be synthesized in a three-step protocol starting from enals or enones **70** *via* Horner-Wadsworth-Emmons (HWE) reaction, DIBAL-H reduction and IBX oxidation sequence, Scheme 60.⁸⁹

Scheme 60: Synthesis of substituted dienals 63

To validate the generality of this method, the optimized reaction conditions were applied to a diverse range of substrates **58b-58p** bearing δ -monosubstituted dienones, Table 10. The reaction was realized to be general and proceeded smoothly to afford the annulated arenes and heteroarenes in excellent yields and stereoselectivities. In general, consistent reaction times were observed irrespective of the electronics and steric factors associated. A variety of indanones **61b**-**61i** bearing δ -aryl or alkyl substituents were assembled in excellent yields, Table 10. The presence of electron donating groups (such as -OMe) either on δ -substitutions **58d** or on aryl rings **58f-58h** was well tolerated under the optimized condition (Table 10, **61d**, **61f-61h**). Dienone appended to 2-naphthaldehyde moiety **58i** also delivered the cyclized product **61i**. The synthesis of cyclopenta-fused chromene **61j** in excellent yield and short reaction time further signified the tolerance of substrate with non-aromatic backbone, Table 10. Pleasingly, our further efforts to extend this method for the synthesis of cyclopenta-fused benzothiophene **61k**, thiophene **61l**, and pyridine **61m** also were successful, Table 10. The β -substituted dienone **58n** also was realized to be very effective under the optimized condition and afforded the indanone **61n** in excellent yield and stereoselectivity, Table 10.

Table 10: Substrate scope: δ -and δ , β -disubstituted dienones

All reactions were done on 0.1 mmol scales. Yields were calculated after silica gel column chromatography. E/Z ratio was determined by ¹H-NMR analysis of the crude reaction mixture.

Enantioselective IMBH reaction of dienones

It is noteworthy that the compounds **580** and **58p** possessing poor electrophile such as ketone were also demonstrated to be excellent substrate under the optimized condition. The cyclopenta[b]- annulated benzothiophene **610** and indanone **61p** bearing a tetrasubstituted carbon atom could be efficiently accessed in excellent yields and diastereoselectivities in short reaction time, Table 10.

After realizing the extremely facile transformation of δ -monosubstituted dienones, we intended to explore the δ , δ -disubstituted dienone substrates. A diverse range of δ , δ -disubstituted dienones **58q-58u** tethered to aryl carboxaldehydes were evaluated under the optimized condition, Table 11. To our delight, the reaction proceeded smoothly to deliver the cyclopenta-fused arenes **61q-61u** in excellent yields and consistently short reaction time, Table 11. Of significance, the substrate with a non-aromatic backbone **58v** was also realized to be equally efficient under the optimized condition and resulted in the cylopentannulated chromene **61v**, Table 11. The table 11 further outlines the tolerability of the substitutions at δ -position across the diene and remarkably broad substrate scope of this protocol.

Table 11: Substrate scope: δ , δ -disubstituted dienone-aldehydes

All reactions were done on 0.1 mmol scales. Yields were calculated after silica gel column chromatography. E/Z ratio was calculated by ¹H-NMR analysis of the crude reaction mixture.

3.2: Development of an enantioselective IMBH reaction

Next, we focused on the development of an enantioselective organocatalytic IMBH reaction of dienones. Towards this, we have initiated the study by investigating the nucleophilic chiral phosphines in various solvent combinations with dienone **58a** as the model substrate, Table 12. The initial screening with bifunctional phosphines **C14, C15** and **C25** was unsuccessful even in fluorinated solvents. The bisnucleophilic phosphines **C16-C19** delivered the desired product in poor to moderate enantioselectivities only in hexafluoroisopropanol (HFIP). However, in HFIP solvent, the amino acid derived bifunctional phosphine **C26** afforded the IMBH adduct **61a** in good yield and enantioselectivity was encouraging. With the initial success in HFIP solvent, we investigated the catalysts **C22** and **C23** in fluorinated solvents. Interestingly, catalyst **C23** furnished the product **61a** in 97% yield and 96% enantioselectivity *only* in HFIP solvent.

All reactions were performed on a 0.1 mmol scale using DCM, toluene, TFT, TFE, and HFIP. Yields were calculated after silica gel column chromatography. E/Z ratio was calculated from the ¹H-NMR spectrum of the crude reaction mixture.

With the optimized reaction condition in hand, we have evaluated various δ -mono and δ , δ -disubstituted dienone-aldehydes, Table 13. All the δ -monosubstituted dienones **58c-58i** possessing aryl backbones generated the respective products **61c-61i** in excellent enantiopurities and near quantitative yields with an improved *E/Z* ratio compared to racemic variants. The versatility of this protocol is furthered with the synthesis of cyclopentannulated chromene **61j** in excellent enantioselectivities. Cyclopenta-fused benzothiophene **61k**, thiophene **61l**, and pyridine **61m** could also be achieved efficiently in high enantiopurities. Substrates bearing δ , δ -disubstituted dienones **58q** and **58t-58v** also proceeded smoothly and efficiently to deliver the

Table 12: Screening of chiral catalysts

respective annulated products **61q** and **61t-61v** in excellent enantioselectivities and yields. This protocol was found to be efficient even in the presence of electron donating groups (such as – OMe) on the aryl backbone **61f-61h**. However, a moderate enantioinduction was realized with the substrate **61d** where electron rich δ -substitution was present. The absolute stereochemistry was determined to be (*S*) from the X-ray crystal structure of **61t** (Fig. 16) and assigned to other products in analogy.

Table 13: Substrate scope: δ -mono and δ , δ -disubstituted dienone-aldehydes

Yields were calculated after silica gel column chromatography. E/Z ratio was calculated from the ¹H-NMR spectrum of the crude reaction mixture.

Figure 16: ORTEP diagram of chiral indanone 61t

3.3: Efforts to gain evidence for 1,4- vs. 1,6-phosphine addition

In principle, the dienones **58** can undergo an initial 1,4- or 1,6-phosphine addition. In an attempt to address this concern, we have designed a substrate E,Z-**58b**, where two double bonds across the dienenone are disposed E and Z, Scheme 61. It is presumed that in the case of 1,4-addition of phosphine (path a) the stereochemical integrity of Z-alkene should remain unchanged leading to the indanone E,Z-**61b**. But in the case of 1,6-addition (path b), the Z-alkene should be equilibrated to thermodynamically stable E-alkene leading to the indanone E,E-**61b**, Scheme 60.

Scheme 61: Our hypothesis towards 1,4-vs. 1,6-addition

Accordingly, a synthetic route was proposed to access the dienone E,Z-58b, Scheme 62. The stereospecific ester 75 was obtained from commercially available phenylpropiolaldehyde 72 *via* Horner-Wadsworth-Emmons reaction using 73 and subsequent Lindlar's hydrogenation. Ester 75 was converted to corresponding primary alcohol and oxidized to obtain the dienal 76. Further, *n*-butyllithium mediated alkylation of 77 with dienal 76 furnished the alcohol 78. Subsequent IBX oxidation of alcohol 78 and acetal deprotection delivered the desired dienonealdehyde E,Z-58b in 4:1 ratio.

Scheme 62: Synthesis of dienone-aldehyde E,Z-58b

Page 59

Page 61

The IMBH reaction was performed on dienone E,Z-58b under the optimized condition to obtain the indanone **61b'** (eq. 1, Scheme 63). At this stage, we could not realize the stereochemical information across the double bond. Thus, **61b'** was oxidized using tetrapropyl-ammonium perruthenate (TPAP) to indanedione **79**. A careful analysis of the ¹H-NMR spectrum of **79** revealed the presence of *E*-configured double bond across the diene. The IMBH reaction also was performed in the presence of phosphine **C23** (eq. 2, Scheme 63), and the ¹H-NMR of indandione **79** indicated the exclusive formation of the *E*-isomer.⁹⁰

Scheme 63: IMBH reaction of dienone-aldehyde E,Z-58b

3.4: Elaboration towards the synthesis of substituted fluorenones

After successfully synthesizing an array of enantioenriched cyclopenta[*b*]annulated arenes and heteroarenes, we intended to illustrate the synthetic utility of the MBH adducts **61**. A synthetic elaboration was devised to exploit the doubly activated benzylic alcohol functionality and the dienone moiety present in **61a**, Scheme 64. Prompted by our earlier report,⁹¹ it was anticipated that, the acid-mediated generation of the 1,3-dicarbonyl adduct **80a** could undergo a base-mediated cyclization reaction to furnish the hydrofluorenone **82a** (*via* path-a) and/or **84a** (*via* path-b) as depicted in the Scheme 64. Accordingly, indanone **58a** was subjected to a dehydrative nucleophilic substitution reaction in the presence of catalytic bismuth(III)chloride to achieve the acetylacetone adduct **80a**. For the further cyclization of **80a**, a variety of inorganic bases (NaCO₃, NaHCO₃, and K₂CO₃) were evaluated in DMF. Interestingly, the formation of an unexpected product 3-methyl-4-acetyl fluorenone **85a** was realized in a potassium carbonate-mediated reaction at an elevated temperature. It was assumed that the initially formed hydrofluorenone **84a** *via* path-b underwent base mediated deacylation and aromatization sequence to afford the fluorenone **85a**. To further make it interesting, the isolation of the

intermediate **80a** was avoided by optimizing the reaction in a way that the conversion of indanone **61a** to **85a** could be performed in a one-pot telescopic manner.

Scheme 64: Serendipitous formation of 4-acetyl-3-methyl fluorenone 85a

The structure of the 4-acetyl-3-methyl fluorenone **85a** was deduced by careful analysis of IR, NMR, and HRMS data. The presence of two carbonyls at 1714 cm⁻¹ and 1695 cm⁻¹ in the IR absorption spectrum indicated the formation of **85a**. In the ¹H-NMR spectrum (see Fig. 31) the presence of two singlet at δ 2.67 ppm and δ 2.35 ppm due to acetyl methyl and aromatic methyl respectively, and in ¹³C-NMR spectrum (see Fig. 32), the presence of a quaternary carbon at δ 206.7 ppm due to unsaturated acetyl carbonyl (C-2), a signal at δ 192.5 ppm due to fluorenone carbonyl (C-1), and presence of two methyl carbons at δ 32.3 ppm and δ 19.3 ppm due to acetyl methyl and aromatic methyl spectruly established the structure of the fluorenone **85a**. The presence of a deprotonated molecular ion peak at m/z 235.0750 (M-H)⁺ in the HRMS spectrum further confirmed the product formation.

Figure 33: Representative natural products possessing the fluoren-9-one framework

The fluoren-9-one derivatives are often encountered as privileged substructures in a diverse range of natural products exhibiting biological and pharmaceutical activities, Fig. 33. To name a few, caulophine a fluorenone alkaloid isolated from the radix of *Caulophyllum robustum* Maxim shows anti-myocardial ischemia activity. Similarly, gramniphenol analogs isolated from the whole plant extract of *Arundina gramnifolia* displayed promising anti-HIV1 activity. Vitrofolal D natural product possessing a benzo fluorenone skeleton also showed antibacterial activity against methicillin-resistant *Staphylococcus aureus* isolated from the subterranean part of *Vitex rotundifolia*.⁹² Furthermore, functionalized fluorenones have found wide application, especially in organic semiconducting materials, optics and photoelectronics, owing to their unique liquid crystalline, blue photo- and electroluminescence properties.⁹³

Table 14: Telescopic synthesis of 3,4-disubstituted-9-fluorenones

Yields were calculated over two steps after silica gel column chromatography.

To validate the generality of this unprecedented observation few other electronically diverse IMBH adducts **61b**, **61e-61f** and **61h-61i** were subjected to the optimized condition, Table 14. The one–pot telescopic process was realized to be general, effective and a wide range of 3-substituted-4-acetyl fluorenones **85b-85f** were assembled albeit in moderate yields. However, our attempts with other 1,3-dicarbonyls were unsuccessful. This two-step telescopic strategy represents a unique way to access 3-substituted-4-acetyl fluorenones.

In Conclusion, we have demonstrated the first enantioselective intramolecular Morita-Baylis-Hillman reaction of substituted dienones. Highly enantioenriched cyclopenta-fused arenes and heteroarenes were assembled in excellent yields and stereoselectivities. An efficient one-pot telescopic method to convert the IMBH adducts to substituted fluorenones was established.

Section 4

Metal- and Hydride-Free Pentannulative Reductive Aldol Reaction

After accomplishing a mild and highly efficient asymmetric protocol for the synthesis of a diverse range of cyclopentannulated arenes and heteroarenes (as described in section 3), we have conceived that sheer incorporation of α -substitution in **58** would lead to a completely different reactive substrate **86**, as depicted in Scheme 65. It was envisioned that the phosphine could activate the substrate **86** *via* 1,6-addition to furnish the dienolate species **87**, which can undergo intramolecular aldol reaction *via* path-a (γ -addition) leading to fused cycloheptenoids **88** by phosphine elimination.⁹⁴ Alternatively, an intramolecular aldol reaction of the dienolate **87** *via* path-b (α -adduct) would lead to a zwitterion **89**, though the subsequent fate is not realized at this time.

Scheme 65: Our hypothesis towards the synthesis of cycloheptannulated arenes and heteroarenes

In order validate the hypothesis presented in Scheme 65, a model substrate **86** was considered. The α -substituted dienone-aldehyde **86** can be accessed easily in three steps starting from commercially available 2-bromo aldehydes **49**, Scheme 66. The bromo aldehydes were converted to 2-bromo alcohol **50** *via* a straightforward sodium borohydride reduction. Direct *n*-butyllithium mediated alkylation of **50** with α -substituted dienone-aldehydes **86**.

Scheme 66: Synthesis of α-substituted dienone-aldehydes 86

Benzothiophene based substrate **86m** also can be accessed readily in a two-step protocol, Scheme 67. In situ masking of aldehyde functionality in benzothiophene-3-carboxaldehyde **44** and direct α -alkylation afforded the dienol **91**, which upon IBX oxidation generated the dienonealdehyde **86m**. Metal- and hydride-free reductive aldol reaction

Scheme 67: Synthesis of benzothiophene based α -substituted dienone-aldehyde 86m

 α -Substituted dienals **90** employed in this study can be synthesized from enals **92** by employing classical aldol reaction or from **93** *via* Horner-Wadsworth-Emmons (HWE) reaction, DIBAL-H reduction, and oxidation sequence, Scheme 68.⁹⁵

Scheme 68: Synthesis of α-substituted dienals 90

We initiated our study to validate the mechanistic hypothesis proposed in Scheme 65, towards the synthesis of fused-cycloheptenes **88**. The α -methyl dienone-aldehyde **86a** was synthesized by following the procedure shown in Scheme 69. Dienal **90a** was prepared from the commercially available *trans*-cinnamaldehyde **92a** by following the synthetic strategy described in Scheme 68.

Scheme 69: Synthesis of α-substituted dienal-aldehyde 86a

Our earlier success with trimethylphosphine catalyzed cyclopentannulation of dienonealdehydes (section 3) inspired us to apply the prototypical condition during the initial evaluation. However, the substrate **86a** failed to generate any product with catalytic trimethylphosphine in toluene at room temperature. The use of stoichiometric phosphine with a prolonged reaction time furnished a polar compound albeit in low yield, Scheme 70. To our surprise, a careful analysis of the spectral data revealed the exclusive formation of reductive aldol product (α -adduct) **95a** in a 3:1 diastereometric ratio, without a trace of expected fused-cycloheptenes (γ -adduct) **88a**, Scheme 70.⁹⁶ In the ¹H-NMR spectrum (see Fig. 34), the presence of a multiplet at δ 2.75-2.54 ppm due to allylic protons (C-1 protons), a singlet at δ 5.01 ppm due to the benzylic proton (C-3 proton), a doublet at δ 6.44 ppm (J = 15.9 Hz), a triplet of doublet at δ 6.09 ppm ($J_{major} = 15.9$ Hz) due to the presence of a *trans*-olefin, and in ¹³C-NMR spectrum (see Fig. 35), the presence of a downfielded benzylic carbon (C-3) at δ 78.5 ppm, an all-carbon quaternary (C-2) at δ 54.8 ppm, a methylene carbon (C-1) at δ 37.8 ppm asserted the formation of fused-cyclopentane **95a**. In the IR spectrum, a broad absorption band at 3427 cm⁻¹ due to the secondary alcohol and a strong band at 1705 cm⁻¹due to the presence of carbonyl further supported the product formation. In the high-resolution mass spectrum, the presence of protonated molecular ion peak at m/z 279.1394 (M+H)⁺ corroborated the structure of **95a**.

Scheme 70: Reaction of α-substituted dienone-aldehyde 86a

The aldol reaction is one of the most useful synthetic transformations leading to β -hydroxy carbonyl compounds in presence catalytic amount of base or acid. This reaction has been utilized widely for the synthesis of complex molecules due to its atom economical nature.⁹⁷ But, when nonsymmetrical carbonyls are employed, the traditionally used base or acid lead to multiple products *via* the formation of non-regiospecific enolates. These undesired side reactions can be prevented by preforming the enolate prior to the aldol reaction. For example, Mukaiyama described an aldol reaction of preformed silyl enol ether with a carbonyl compound in the presence of Lewis acid.⁹⁸

On the other hand, the reductive aldol reaction (RAR) typically involves a metal catalyzed coupling of an aldehyde with *in situ* formed regioselective enolate in the presence of a hydride source from a α , β -unsaturated carbonyl compound. This reaction is advantageous as the presynthesis of the enolate species is not necessary.⁹⁹

The pioneering concept of the regiospecific generation of enolates from α , β -unsaturated carbonyls *via* dissolving metal reductions and subsequent reaction was introduced by Stork in 1961,¹⁰⁰ paved the way for further advancements in the area of reductive aldol reaction. Consequently, numerous impressive contributions are made by several researchers by manifesting the above concept.

For example, among the metal catalyzed RARs, a seminal contribution was reported by Revis in 1987.¹⁰¹ Revis *et al.* disclosed a Rhodium-catalyzed intermolecular reductive aldol reaction of acrylate **96a** in the presence of trimethylsilane, Scheme 71. This mild and efficient protocol furnished a wide variety of β -siloxy esters **96c** in excellent yields.

Scheme 71: Revis' Rhodium-catalyzed intermolecular RAR

In 1998, Kiyooka *et al.*¹⁰² have documented a palladium catalyzed intermolecular hydrosilylation of unsaturated carbonyls, Scheme 72. The reaction of acrylamides/acrylates **97a** and aldehydes **97b** in the presence of tetrakis(triphenylphosphine)palladium(0) and trichlorosilane generated the β -siloxy carbonyls **97c** in excellent yields and moderate diastereoselectivities.

Scheme 72: Kiyooka's Palladium catalyzed intermolecular RAR

In 2001, Morken *et al.*¹⁰³ reported iridium catalyzed asymmetric intermolecular RAR of acrylates, Scheme 73. Highly diastereo- and enantioselective aldol products **98c** were obtained in good yields in the presence [(cod)IrCl]₂, indane-Pybox **98d** and silane.

Scheme 73: Copper-catalyzed enantioselective intermolecular RAR

In 2002, Krische *et al.*¹⁰⁴ developed an intramolecular hydrogenative coupling reaction, Scheme 74. Under the rhodium catalysis, an intramolecularly tethered enone and aldehydes **99a** led to the formation of five and six-membered carbocycles **99b** in excellent diastereoselectivities. They have employed hydrogen gas as a reducing agent. In another parallel approach, Krische¹⁰⁵ has utilized a cobalt complex to perform a similar transformation in the presence of phenyl silane as a reductant, Scheme 74.

Scheme 74: Krische's intramolecular hydrogenative coupling

In 2004, Baba *et al.*¹⁰⁶ established a Lewis acid catalyzed RAR, Scheme 75. The *in situ* generated HInBr₂ from InBr₂ and triethylsilane undergoes reductive 1,4-addition with the enone **100a** to generate the indium enolate and subsequently reacts with the aldehydes **100b** *via* a Zimmerman-Traxler type six-membered chair transition state **100c** to afford the highly diastereoselective β -siloxy ketones **100d**.

Scheme 75: Baba's Lewis acid mediated intermolecular RAR

In 2006, Kanai and Shibasaki¹⁰⁷ have utilized allenoates **101a** as a latent enolate and exploited in the Copper(I) catalyzed enantioselective reductive aldol reaction, Scheme 76. Pinacolborane was used as a reducing agent. The authors have demonstrated the switch of product selectivity depending on the use of chiral phosphine ligand and copper salt. The DTBM-SEGPHOS **101f** in the presence of CuOAc furnished the γ -addition adducts **101c**. Whereas, the CuF and Taniaphos **101e** exclusively led to the formation of α -adducts **101d** in excellent enantiopurities.

Scheme 76: Enantioselective RAR of allenoates

In 2006, Ryu *et al.*¹⁰⁸ have shown Ruthenium catalyzed reductive dimerization of α , β unsaturated aldehydes, Scheme 77. The RuHCl(CO)(PPh₃)₃ mediated formation of reductive aldol product **102b** further undergoes transfer hydrogenation in the presence of isopropanol to give the α -hydroxymethyl ketones **102c** in moderate yields. Metal- and hydride-free reductive aldol reaction

Scheme 77: Ryu's reductive dimerization

In 2013, Roush *et al.*¹⁰⁹ described a highly diastereo- and enantioselective reductive *syn*aldol reaction by employing diisopinocampheylborane, Scheme 78. The generation of stereospecific (*Z*)-boron enolate through the hydroboration of 4-acryloylmorpholine **103a** and subsequent reaction with the aldehyde **103b** is believed to be proceeding *via* a chair like transition state **103c**. Wide varieties of *syn*- α -methyl- β -hydroxymorpholine amides **103d** were accessed in high enantiopurities.

Scheme 78: Roush's enantioselective reductive syn-aldol reaction

In 2018, Schindler *et al.*¹¹⁰ demonstrated a Lewis base promoted the construction of β -hydroxy lactones and lactams, Scheme 79. The tris(*p*-methoxyphenyl)phosphine oxide (TPPO) with trichlorosilane as reductant resulted in the formation of aldol product through a boat like transition state **104c**. This method provides access to highly diastereoselective lactones and lactams **104d** possessing an all-carbon quaternary center.

As showcased above, the literature survey unfolded a few important aspects of reductive aldol reaction: (i) the reaction required stoichiometric amount of reducing agent (hydrogen gas, silane, borane or metal hydride), (ii) most of the protocols rely on the use of transition metal catalysts (Pd, Rh, Ru, In, Co, Cu, Ir), (iii) no other Michael acceptors are known other than enone, (iv) enones possessing α - or α , β - substitutions (Fig. 36) are less explored.

Figure 36: Substrate designs for the intermolecular reductive aldol reaction

Recently, Ouyang and Chen¹¹¹ disclosed an organophosphine mediated interrupted Morita-Baylis-Hillman type reaction, Scheme 80. In the presence of stoichiometric tributylphosphine, oxindole **106a** undergoes a formal reductive aldol reaction with various electrophiles **106b** to afford **106c** bearing an all carbon quaternary center. The reaction involves an initial formation of zwitterionic enolate species, subsequent aldol reaction, and a dephosphoration process. Excellent enantioselectivities were achieved by employing the chiral bifunctional thiourea catalyst **106d** in stoichiometric amount. This reaction represents the first example of metal- and hydride free intermolecular reductive aldol reaction of enones.

Scheme 80: Chen's interrupted Morita-Baylis-Hillman reaction

Interestingly, our observation described in Scheme 70 represents an unprecedented metaland hydride free organophosphine-mediated intramolecular reductive aldol reaction of α substituted dienone-aldehydes.

4.1: Results and Discussion

After the initial result with the trimethylphosphine, further efforts were made to find out the optimized condition as depicted in Table 15. The substantial increment of PMe₃ loading improved the yield but was not practically encouraging (Table 15, entry 1). An optimization with catalytic tributylphosphine was unsuccessful (Table 15, entry 2), whereas a sub-stoichiometric loading delivered the desired product **95a** in low yield (Table 15, entry 3). To our surprise, the water additive showed a dramatical effect to the reaction yield (Table 15, entries 4-6).¹¹² Our intentions to improve the yield and time succeeded while optimizing the quantity of water (Table 15, entries 6-8). The use of 30 equivalent of water found to be the optimal beyond which no further improvement was observed in the yield or reaction time (Table 15, entries 9 and 10). Further efforts with optimizing the quantity of phosphine in the presence of 30 equivalent of water revealed the use of 1.2 eq. PBu₃ is optimal (Table 15, entries 11-14). The brief solvents screening did not offer any promising result (Table 15, entries 15-17). Other *P*-centered or *N*-centered Lewis bases failed to produce even a trace of the desired product (Table 15, entries 18-21).

To expand the substrate scope of this method, the optimized condition was employed to a wide variety of α -substituted dienone-aldehydes **86b-86m** bearing different steric and electric features, Table 16. A diverse range of cyclopentannulated arenes and heteroarenes 95b-95m could be assembled in good to excellent yields, and moderate to good diastereoselectivities possessing two contiguous stereogenic centers, one of them being an all-carbon quaternary center, Table 16.¹¹³ Regarding the α -substitution (R²) both alkyl **86b**, **86d-86m** and aryl groups 86c were well tolerated under the reaction condition, Table 16. The presence of an electrondonating group (such as -OMe) either on an aryl 95j-95g or at δ -position of the dienone moiety 95d has no considerable impact on the reaction time and yield, Table 16. Contrary to our expectation, the presence of an electron withdrawing (such as -F) group on aryl moiety 86f showed a significant drop of yield and afforded indanone 95f, Table 16. Substrate bearing naphthalene backbone 86k efficiently generated the reductive aldol product 95k in excellent yield, Table 16. A dramatic influence on reaction efficiency was realized with the electron deficient pyridine substrate 861 under the optimized condition and delivered the pyrindanone 951 in excellent yield and diastereoselectivity. Pleasingly, the α -methyl dienone appended to the benzothiophene carboxaldehyde moiety 86m also proceeded smoothly to afford the

cyclopent[b]annulated benzothiophene **95m**, Table 16. The method appears to be robust and general on a wide range of substrates.

Table 15: Optimization of reaction parameters

All reactions were performed on 0.1 mmol scales. ^{*a*} Yields were calculated after silica gel column chromatography.

Table 16: Substrate Scope: Annulated cyclopentanoids via an intramolecular RAR

However, this method is not without limitations. While studying the role of substitutions across the diene in the reductive aldol process, the dienone having a γ -substitution **86n** and dienone with δ , δ -disubstitution **86o** failed to undergo reductive aldol reaction, Table 17.

Table 17: Substrates failed to deliver intramolecular reductive aldol product

4.2: Mechanistic Insights

Based on the optimization result presented in Table 15, it can be perceived that the reaction is proceeding through a stoichiometric pathway with respect to phosphine. Few other aspects were considered to gain mechanistic insights, (i) 1,4- *vs* 1,6-phosphine addition (ii) the role of water, and (iii) the fate of the phosphine after the reaction. To address the above, we have performed a few control experiments as described below.

4.2.1: 1,4- vs. 1,6- phosphine addition

We have hypothesized a substrate design E,Z-86a in order to gain evidence for an initial phosphine addition (1,4- *vs.* 1,6), as shown in Scheme 81. Presumably, in the case of 1,4-phospha Michael, the configuration of the Z-alkene should remain unchanged and lead to the formation of Z-95a (path a). Whereas, in the case of the 1,6-addition, the Z-alkene across the diene should lead to the thermodynamically preferred E-95a (path-b).

Scheme 81: Hypothesis for 1,4- vs. 1,6-phosphine addition

Accordingly, a synthetic route was proposed for *E*,*Z*-86a, as depicted in Scheme 82. The ynenal 109 was procured starting from commercially available phenylpropiolaldehyde 72 *via* a sequential Wittig-Horner-Emmons reaction using 107, DIBAL-H reduction, and IBX oxidation. Further *n*-butyllithium mediated alkylation of 2-(2-bromophenyl)-1,3-dioxolane 77 with ynenal 109 delivered the alcohol 110. Finally, alcohol 110 was converted to the desired dienone *E*,*Z*-86a (Z/E = 6:1) by following an IBX oxidation, acetal deprotection, and Lindlar's hydrogenation sequence (see Fig. 37-42).

Scheme 82: Synthesis of dienone-aldehyde E,Z-86a

The dienone-aldehyde E,Z-86a was subjected to the optimized condition, Scheme 83. The presence of a doublet at δ 6.25 ppm (J = 15.9 Hz) and a triplet of a doublet at 6.13 ppm ($J_{\text{major}} = 15.9$ Hz) in the ¹H-NMR spectrum of the isolated reductive aldol product E-95a revealed the exclusive formation of E-isomer (see Fig. 43 and Fig. 44). This result indicates that the initial phosphine addition occurs in a 1,6-conjugate manner.

Scheme 83: Reductive Aldol reaction of dienone-aldehyde E,Z-86a

Metal- and hydride-free reductive aldol reaction

Page **87**

Page 88

4.2.2: Reductive aldol reaction of 86a in the presence of D_2O

The reductive aldol reaction (RAR) of **86a** was carried out in the presence of D₂O, Scheme 84. Dienone **86a**, dissolved in DMF (1 mL) was treated with tributylphosphine (1.2 eq.) in the presence of 30 equivalent of D₂O at room temperature and continued stirring for 48 h before commencing the purification. The reaction resulted in the formation of **95a-D** in 80% yield. The *D*-incorporation was realized to be 89% at δ -position and 79% at the β -position in **95a-D** from the ¹H-NMR spectrum (see Fig. 45-48). The *D*-incorporation indicates that the β and δ -carbons experience an anionic character at a certain stage during the product formation.

Scheme 84: Reductive aldol reaction of 86a in the presence of D₂O

Metal- and hydride-free reductive aldol reaction

4.2.3: Reductive aldol reaction of 86a in the presence of $H_2^{18}O$

The role of water during the transformation was investigated by using the ¹⁸O-labelled water, Scheme 85. The dienone-aldehyde **86a** dissolved in DMF (1.0 mL) was treated with tributylphosphine (1.2 eq.) in the presence of $H_2^{18}O$ (30 eq.). Once the starting material **86a** disappeared (as monitored by TLC), the crude reaction mixture was subjected to high-resolution mass spectrometry (HRMS) analysis. The abundance of the peak at **221.1916** [calculated (M+H)⁺: **221.1920**] for P(¹⁸O)Bu₃ in H₂¹⁸O reaction (see Fig. 49) was found to be significantly increased than the respective abundance of P(¹⁸O)Bu₃ peak at **221.1905** [calculated (M+H)⁺: **221.1920**] obtained from water reaction (see Fig. 50). This result confirms that water is responsible in the elimination of phosphine as phosphine oxide.¹¹⁴

Scheme 85: Reductive aldol reaction of 86a in the presence of $H_2^{18}O$

Figure 49: HRMS spectrum of the crude reaction mixture obtained from RAR of 86a in the

presence of H₂O

presence of $H_2^{18}O$
Based on the evidence obtained from the control experiments, a plausible mechanism is outlined in Scheme 86.¹¹⁵ The initial 1,6-phosphine addition to **86a** leads to the formation of dienolate **87a** *via* path a, and undergoes intramolecular aldol reaction to form the zwitterion **113a**. The water-mediated protonation of alkoxide and phosphine oxide elimination generates the anionic species **114a**. The subsequent protonation of **114a** can proceed either *via* formation of **115a** followed by 1,3-proton shift (path c) or *via* direct protonation (path d) to afford the desired product **95a**. The origin of diastereoselectivity could be attributed to the hydrogen bonding ability of water, where the water promoted 1,6-phosphine addition to **86a**, and subsequent intramolecular aldol reaction *via* path b (intermediate **87a'**) can directly lead to the formation of **114a**, possessing *syn* stereochemistry, which explains the stereochemical outcome.

Scheme 86: Plausible mechanism of the intramolecular RAR

4.3: Efforts towards an enantioselective intramolecular RAR

As the reductive aldol products possess two contagious stereogenic centers, we have focused on developing an asymmetric RAR. Based on our earlier success on asymmetric IMBH reaction of enone/dienone-aldehydes (as described in section 2 and 3), a variety of chiral phosphines and solvent combinations were tested, Table 18. Surprisingly, the bifunctional catalysts C13-C15, C21, C23, C25, C30, and bis-nucleophilic chiral phosphines C16-C19, C27 were unsuccessful. A combination of (R)-BINOL C9 and Lewis base led to poor

enantioinduction. Gratifyingly, the *exo*-Kwon catalyst¹¹⁶ **C29** delivered the desired product in good yield and moderate enantioselectivity only in HFIP. Several of our efforts to further improve the enantioselectivity failed.

All reactions were performed on 0.05 mmol scales using DCM, toluene, hexafluoroisopropanol (HFIP), and trifluorotoluene (TFT) as solvent at room temperature in the presence of 30 eq. of water additive.

4.4: Synthetic utility of RAR products

4.4.1: Synthesis of fused γ-lactones

The γ -lactones are privileged substructure present in many natural products and biologically active molecules. Fused γ -lactones are widely used in the perfume industry due to their pleasant odor. Strigolactones, a class of fused γ -lactone derivatives isolated from root exudates of mono- and dicotyledonous plants, play an important role in plant-plant or plant-fungi communications and plant growth, Fig. 51. In the last few decades, (+)-GR24, a synthetic strigolactone mimic, has been used extensively in plant positive assay as they are more potent than their parent molecules. The only aromatic ring-containing natural strigolactone, (–)-Solanacol was isolated from *Nicotiana tabacum* L, which is highly active to seed germination process, Fig. 51.¹¹⁷

Figure 51: Representative examples of γ -lactone fused bioactive molecules

Because of the significance of indanone-fused γ -lactones described above, the developments of new methodologies to access them are of great importance. Accordingly, we have applied Borhan's lactonization protocol¹¹⁸ to the reductive aldol product **95a**, Scheme 87. Indanone **95a** upon reaction with catalytic osmium tetroxide and excess of oxone as co-oxidant in dimethylformamide underwent smooth lactonization to afford **113a** in 71% yield. The presence of an *AB*_{quartet} at δ 2.85 ppm (*J* = 19.2 Hz) and δ 2.85 ppm (*J* = 19.2 Hz) in the ¹H-NMR spectrum (see Fig. 52) and a lactone carbonyl at δ 174.5 ppm in ¹³C-NMR (see Fig. 53) confirmed the product formation.

Scheme 87: Lactonization of reductive aldol product 95

Few other indanone-fused γ -lactone analogs **113b-113e** were synthesized by employing the same protocol, Table 19. Interestingly, the complete molecular framework of (+)-GR24 or (–)-Solanacol can be achieved in one step from lactone **113** by following the literature method.¹¹⁹ The *cis*-stereochemistry along the ring junction of fused γ -lactones was confirmed from the crystal structure of **113c**, Table 19.

Table 19: Synthesis of indanone-fused γ -lactone analogs 113

Reactions were done on 0.1 mmol scales. Yields based on silica gel column chromatography

4.4.2: Synthesis of dihydroindeno[1,2-b]-pyrans and dibenzo[a,h]-azulen-8-ones

Cyclic ethers are considered as basic building blocks in organic chemistry. They are often encountered as important structural motifs in marine natural products, Fig. 54. Among the cyclic ethers, tetrahydropyrans are used widely as they find applications in pharmaceuticals, cosmetics, and foodstuff.¹²⁰ Numerous methods are known to synthesize tetrahydropyrans such as Prins cyclization, Diels-alder reaction, and intramolecular Michael reaction.¹²¹ An intramolecular addition of alcohol across the pendant olefin in the presence of Lewis acids also often utilized to access the tetrahydropyrans in an atom economic manner.¹²²

Page 97

Metal- and hydride-free reductive aldol reaction

Reactions were performed on 0.1 mmol scales. ND = not determined

Herein, we have adopted a protocol to access the fused tetrahydropyrans by exploiting the benzylic alcohol and pendant styrenyl groups present in the reductive aldol products **95**. Accordingly, the indanone **95a** was subjected to catalytic $BF_3 OEt_2$ in dichloromethane. Desired dihydroindeno-pyran **114a** was isolated in 23% yield after 48 h (Table 20, entry 1). To further improve the reaction yield, a brief screening was performed, Table 20. The stoichiometric amount of the Lewis acids such as FeCl₃, BiCl₃ were able to afford the pyran **114a** only in moderate yields (Table 20, entries 2-5). Brønsted acid was effective only at elevated temperature (Table 20, entry 6). Stoichiometric BF₃ OEt₂ displayed the best result in dichloromethane (Table

20, entry 7). The structure of pyran **114a** was confirmed by-NMR analysis (see Fig 56 and Fig 57). The stereochemistry was assigned based on the crystal structure **115** obtained from the hydrazone derivative of **114a**, Fig. 55.

Figure 55: ORTEP diagram of pyran 115

The optimized condition provided general access to the other dihydroindeno[1,2-*b*]pyran analogs **114b-114f** in excellent yields and moderate diastereoselectivities, Table 21. A plausible mechanism is proposed based on the literature evidence; Table 21.^{122b} BF₃·OEt₂ initially activates the benzylic alcohol of **95** to form **116** by releasing hydrogen fluoride. The proton (generated from HF) further adds to the less hindered side of the olefin to give more stable carbocation **117** and subsequent cyclization by the alkoxide forms the tetrahydropyran **114**.

Reactions were performed on a 0.1 mmol scale. Yields were calculated after silica gel column chromatography. dr ratio was calculated from the ¹H-NMR spectrum of the crude reaction mixture.

Metal- and hydride-free reductive aldol reaction

Surprisingly, indanones **95h** and **95i** up on treatment with $BF_3 OEt_2$ afforded dibenzo[*a*,*h*]- azulen-8-ones **118a** and **118b**, Scheme 88. It was assumed that the presence of a *para*-methoxy group to the benzylic alcohols **95h** and **95i** facilitates the *para*-quinone methide formation **119** and eventually cyclizes to form **118a** and **118b**. In the case of indanone **95g** and **95j**, the similar reactivity pattern was not observed where the methoxy groups were situated *meta* to the benzylic alcohol and afforded fused pyran **114d** and **114e** respectively, Table 21. The tetracyclic dibenzo[*a*,*h*]- azulen-8-one moiety of **118** represents a part structure of the immune-suppressive natural products dalesconol A (**120a**) and B (**120b**), Scheme 88.¹²³

Scheme 88: Synthesis of dibenzo[*a*,*h*]-azulen-8-ones 118

In conclusion, we have disclosed the first metal- and hydride/hydrogen free intramolecular reductive aldol reaction of dienones. Highly functionalized cyclopenta[b]nnulated arenes and heteroarenes were accessed under extremely mild and moisture insensitive condition in excellent regio- and diastereoselectivities. The unusual role of water as terminal oxidant was also discovered. Control experiments thoroughly elucidated the mechanistic details. To illustrate the general utility of the reductive aldol products, we have demonstrated a series of serendipitous one-step elaborations. These strategies provide efficient access to indeno-[1,2-b]furanones, indeno[1,2-b]pyrans, and dibenzo[a,h]-azulen-8-ones.

Conclusions

In conclusion, we have demonstrated an intramolecular Morita-Baylis-Hillman (IMBH) reaction of previous unexplored β -mono and β , β -disubstituted enones to access cyclopenta-fused arenes and heteroarenes in excellent yields. Further, an enantioselective version also was developed by employing bifunctional thiourea catalyst in hexafluoroisopropanol. This strategy was extended to design another IMBH substrate possessing dienones. Toward this, we have described an efficient enantioselective IMBH reaction of δ -mono and δ , δ -disubstituted dienones to afford highly enantioenriched fused-cyclopentanes in nearly quantitative yields. The IMBH adducts were successfully elaborated to substituted fluorenones in a one-pot telescopic manner.

Continued research interest in developing new strategies to achieve fused-cyclopentanes led us to develop an intramolecular reductive aldol reaction. We have described a phosphine and water-mediated intramolecular reductive cyclization of α -substituted dienone-aldehydes to synthesize a diverse range of cyclopenta[*b*]nnulated arenes and heteroarenes bearing two contagious stereogenic centers, one of them being an all-carbon quaternary center, in good yields and diastereoselectivities. Further, a series of serendipitous one-step elaborations of reductive aldol products were established. These strategies describe efficient access to indeno-[1,2*b*]furanones, indeno[1,2-*b*]pyrans, and dibenzo[*a*,*h*]-azulen-8-ones.

Experimental Section

General experimental methods: All the starting compounds and catalysts employed in this study were procured from Sigma-Aldrich, TCI chemicals, Avra Synthesis and were used without further purification. For thin layer chromatography (TLC), silica aluminium foils with fluorescent indicator 254 nm (from Aldrich) were used and compounds were visualized by irradiation with UV light and/or by treatment with a solution of *p*-anisaldehyde (23 mL), conc. H₂SO₄ (35 mL), and acetic acid (10 mL) in ethanol (900 mL) followed by heating. Column chromatography was performed using SD Merck silica gel 60-120 mesh (approximately 15-20 g per 1 g of the crude product). Dry THF was obtained by distillation over sodium and stored over sodium wire. IR spectra were recorded on a Perkin-Elmer FT IR spectrometer as thin films or KBr pellet, as indicated, with v_{max} in inverse centimetres. Melting points were recorded on a digital melting point apparatus Stuart SMP30. ¹H-NMR and ¹³C-NMR spectra were recorded on a 400 MHz Bruker Biospin Avance III FT NMR spectrometer. NMR shifts are reported as delta (δ) units in parts per million (ppm) and coupling constants (J) are reported in Hertz (Hz). The following abbreviations are utilized to describe peak patterns when appropriate: br=broad, s=singlet, d=doublet, t=triplet, q=quartet and m=multiplet. Proton chemical shifts are given in δ relative to tetramethylsilane (δ 0.00 ppm) in CDCl₃ or in (CD₃)₂SO (δ 2.50 ppm) or in (CD₃)₂CO (δ 2.05 ppm). Carbon chemical shifts are internally referenced to the deuterated solvent signals in CDCl₃ (δ 77.1 ppm) or in (CD₃)₂SO (δ 39.5 ppm) or in (CD₃)₂CO at δ 29.9 and 206.7. Single crystal X-ray analysis was carried on a Bruker AXS KAPPA APEX II system or Rigaku XtaLAB mini X-ray diffractometer. High-resolution mass spectra were recorded on a Waters QTOF mass spectrometer. Optical rotations were recorded on Rudolph APIII/2W. HPLC data was acquired from a Waters 515 using normal phase chiral columns.

General procedure 1: Synthesis of enones 42a-42f and 42w-42aa

Step-I: To a solution of *N*-methylpiperazine (NMP, 0.18 mL, 1.6 mmol) in THF (5 mL) at -78 ^oC was added *n*-BuLi (1.6 *M* in hexane, 1.0 mL, 1.6 mmol). After 15 min, thiophene- or benzothiophene 3-carboxaldehyde **44** (200 mg, 1.2 mmol) was added and then the reaction mixture was stirred for an additional 30 min. A hexane solution of *n*-BuLi (2.0 mL, 3.2 mmol) was added and the mixture was stirred for an additional 15 min and then the mixture was warmed to -30 ^oC in 2 h. The solution was again cooled to -78 ^oC and an enal **47** (1.5 mmol) was added drop wise over 5 min. The mixture was warmed to room temperature over 30 min.

The reaction progress was monitored by TLC. The reaction mixture was quenched with saturated aqueous ammonium chloride solution and extracted with ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford enol **46**.

Step-II: Alcohol **46** (1 mmol) was dissolved in ethyl acetate (10 mL), and IBX (1.5 mmol) was added. The resulting suspension was immersed in an oil bath set to 75 °C and stirred until alcohol **46** disappeared as monitored by TLC. The reaction was cooled to room temperature and filtered through Buchner funnel. The filter cake was washed with ethyl acetate (3×2 mL). Organic extracts were combined and worked up using saturated sodium bicarbonate solution to remove excess iodobenzoic acid. The extract was dried over anhydrous sodium sulphate and concentrated under vacuum. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford the enones **42a-42f** and **42w-42aa**.

General procedure 2: Synthesis of enone-ketone 42ap

In to solution of Alcohol **46** in dry THF, methyl magnesium bromide (1.2 eq.) was added at 0 °C. The reaction was continued until the starting alcohol **46** disappeared as monitored by TLC. The reaction mixture was quenched by saturated aqueous ammonium chloride and extracted using ethyl acetate. Organic extracts were combined, dried over anhydrous sodium sulphate, and concentrated to afford the diol **48a** and proceeded to the next step without purification. Subsequent IBX oxidation of diol **48a** delivered the desired enone-ketone **42ap**.

General procedure 3: Synthesis of arene and pyridine based enone-aldehydes 42

Step-I: An oven dried 25 mL RB flask was charged with 2-bromo aldehydes **49** (2.0 mmol), 10 mL dry MeOH and placed at 0 °C. Sodium borohydride (2.1 mmol) was added portion wise under nitrogen atmosphere and stirred at room temperature until **49** disappeared (monitored by TLC) and quenched by saturated aqueous ammonium chloride. Methanol was removed under vacuum and extracted using ethyl acetate. Organic extracts were combined and dried over anhydrous sodium sulphate and concentrated to afford crude 2-bromo alcohol **50** and proceeded

to the next step without further purification. Alternatively, aldehyde **49** was treated with an appropriate Grignard reagent in dry THF to access the secondary alcohol **50**.

Step-II: An oven dried 25 mL long neck RB flask was charged with 2-bromo alcohol **50** (1.0 mmol), 5 mL dry THF and placed at -78 °C. *n*-BuLi (1.6 *M* in hexanes, 2.2 mmol) was added drop wise at same temperature and stirred for 2 hours. An enal **47** (1.3 mmol) dissolved in 1 mL of dry THF, was added drop wise over 2 mins and stirred at room temperature for 30 mins. The reaction mixture was quenched with saturated aq. ammonium chloride solution and extracted using ethyl acetate. The organic extracts were combined dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford diol **51**.

Step-III: The diols **51** were oxidized using IBX following the general procedure 1, step II to afford enones **42**.

General procedure-4: Intramolecular MBH reaction of enones 42

An oven dried 5 mL glass vial was charged with **42** (30 mg, 0.1 mmol). Toluene (1 mL) and PMe₃ (1 M solution in toluene, 0.1 mL, 0.01 mmol) were introduced at room temperature (rt) under nitrogen atmosphere and stirring continued at rt until **42** disappeared as monitored by TLC. All the volatiles were removed under reduced pressure. The crude product was purified by silica gel flash chromatography using hexane/ethyl acetate as eluent, to afford **43**.

General Procedure-5: Enantioselective IMBH reaction of enones 42

An oven dried 5 mL glass vial was charged with **42** (30 mg, 0.1 mmol) in 1,1,1,3,3,3hexafluoroisopropanol (HFIP, 0.6 mL), catalyst **C23** was introduced at room temperature (rt) under nitrogen atmosphere and stirring continued at rt until **42** disappeared as monitored by TLC. Volatiles were removed under reduced pressure. The crude product was purified by silica gel flash chromatography using hexane/ethyl acetate as eluent, to afford **43**.

(*E*)-2-(Hex-2-enoyl)benzo[*b*]thiophene-3-carbaldehyde (42a).

This compound was prepared by following the general procedure **1** and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 2962, 2873, 1674, 1663, 1614, 1501, 1178, 1087, 758. ¹H-NMR (400 MHz, CDCl₃): δ 10.63 (s, 1H), 8.81-8.79 (m, 1H),

7.93-7.90 (m, 1H), 7.59-7.55 (m, 2H), 7.23 (dt, J = 15.3 and 1.5 Hz, 1H), 6.81 (dt, J = 15.3 and 1.5 Hz, 1H), 2.38 (dq, J = 7.2 and 1.5 Hz, 2H), 1.61 (qd, J = 14.8 and 7.4 Hz, 2H), 1.02 (t, J = 7.4 Hz, 3H). ¹³C-NMR (100 **MHz, CDCl₃**): δ 187.9, 184.8, 153.3, 150.2, 139.1, 136.6, 136.5, 128.6, 127.9, 126.9, 126.7,

122.2, 34.9, 21.3, 13.7. **HRMS (ESI):** m/z calcd for C₁₅H₁₅O₂S (M+H)⁺: 259.0793. Found: 259.0778.

(E)-2-Butylidene-1-hydroxy-1H-benzo[b]cyclopenta[d]thiophen-3(2H)-one (43a).

QН This compound was isolated as a pale yellow solid. Following the general C₃H7 procedure 4, 30 mg of 42a afforded 28 mg of 43a (93% yield). M.P = 100-101 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 43a (E/Z = 10:1) 3386, 2960, 2873, 1688, 1650, 1514, 1425, 1096, 743. ¹H-NMR (400 MHz, CDCl₃): δ 8.14-8.12 (m, 1H), 7.92-7.90 (m, 1H), 7.55-7.48 (m, 2H), 6.84 (td, J = 7.8 and 1.4 Hz, 1H), 5.87 (s, 1H), 2.64-2.47 (m, 2H), 2.30 (br s, 1H), 1.67-1.57 (m, 2H), 1.04 (t, J = 7.4 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): 8 184.8, 159.3, 148.0, 144.4, 142.2, 140.5, 133.3, 128.3, 125.5, 124.6, 124.3, 66.7, 30.9, 22.0, 14.0. **HRMS (ESI):** *m/z* calcd for C₁₅H₁₃OS (M-OH)⁺: 241.0687. Found: 241.0657.

(*E*)-2-(Dec-2-enovl)benzo[*b*]thiophene-3-carbaldehvde (42b).

This compound was prepared by following the general procedure 1 and isolated as pale yellow oil. $R_f = 0.6$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2964, 2871, 1672, 1665, 1614, 1505, 1090, 743. ¹H-NMR

(400 MHz, CDCl₃): δ 10.67 (s, 1H), 8.79-8.77 (m, 1H), 7.91-7.89 (m, 1H), 7.57-7.54 (m, 2H), 7.22 (td, J = 15.2 and 6.9 Hz, 1H), 6.80 (td, J = 15.3 and 1.3 Hz, 2H), 1.65-1.52 (m, 2H), 1.40-1.31 (m, 9H), 0.91 (t, J = 7.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 187.9, 184.9, 153.6, 139.1, 136.63, 136.60, 128.4, 127.8, 126.9, 126.7, 122.2, 122.1, 32.9, 31.7, 29.2, 29.0, 27.9, 22.6, 14.1. **HRMS (ESI):** m/z calcd for C19H23O2S (M+H)⁺: 315.1418. Found: 315.1409.

(E)-1-Hydroxy-2-octylidene-1H-benzo[b]cyclopenta[d]thiophen-3(2H)-one (43b).

This compound was isolated as pale yellow oil. Following the general procedure 4, 30 mg of 42b afforded 27.5 mg of 43b (92% yield). $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat):

 v_{max}/cm^{-1} 3423, 2930, 2856, 1689, 1599, 1285, 1239, 1024. ¹H-NMR (400) **MHz**, **CDCl**₃): δ 8.17-8.13 (m, 1H), 7.97-7.93 (m, 1H), 7.58-7.52 (m, 2H), 6.88 (td, J = 7.8 and 1.4 Hz, 1H), 5.90 (d, J = 9.3 Hz, 1H), 2.67-2.50 (m, 2H), 2.03 (d, J = 10.4 Hz, 1H), 1.63-1.54 (m, 3H), 1.45-1.26 (m, 7H), 0.91 (t, J = 7.1 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 184.7, 159.2, 148.0, 144.6, 142.0, 140.8, 133.3, 128.3, 125.5, 124.6, 124.3, 66.8, 31.7, 29.4, 29.1, 29.0, 28.7, 22.6, 14.1. HRMS (ESI): m/z calcd for $C_{19}H_{23}O_2S (M+H)^+$: 315.1418. Found: 315.1410.

2-Cinnamoylbenzo[b]thiophene-3-carbaldehyde (42c).

This compound was prepared by following the general procedure 1 and Ph isolated as pale vellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2924, 2854, 1673, 1652, 1593, 1498, 1087, 758. ¹H-NMR (**400 MHz, CDCl₃**): δ 10.77 (s, 1H), 8.84-8.81 (m, 1H), 7.96-7.94 (m, 1H), 7.93 (d, *J* = 15.6 Hz, 1H), 7.70-7.68 (m, 2H), 7.61-7.58 (m, 2H), 7.51-7.47 (m, 3H), 7.43 (d, J = 15.6 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 188.0, 184.4, 150.3, 147.4, 139.1, 138.8, 136.6, 133.9, 131.5, 129.1(2C), 128.9(2C), 128.0, 127.0, 126.8, 124.0, 122.3. HRMS (ESI): m/z calcd for C₁₈H₁₃O₂S

(M+H)⁺: 293.0636. Found: 293.0659.

(R,E)-2-Benzvlidene-1-hydroxy-1*H*-benzo[*b*]cyclopenta[*d*]thiophen-3(2*H*)-one (43c).

This compound was isolated as pale yellow solid. Following the general procedure 5, 30 mg of 42c afforded 27.6 mg of 43c (92% yield). M.P = 121-122 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3333,

2926, 1673, 1620, 1017, 919, 742. ¹H-NMR (400 MHz, (CD₃)₂SO): δ 8.25-8.20 (m, 2H), 8.06 (d, J = 7.2 Hz, 2H), 7.66-7.59 (m, 2H), 7.55-7.46 (m, 3H), 7.45 (s, 1H), 6.24 (d, J = 9.8 Hz, 1H),6.17-6.13 (m, 1H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 186.0, 162.4, 147.4, 142.8, 141.7, 134.1, 133.8, 133.7, 132.3(2C), 130.4, 129.2(2C), 129.1, 126.2, 125.4, 125.2, 65.8. HRMS (ESI): m/z calcd for $C_{18}H_{13}O_2S$ (M+H)⁺: 293.0636. Found: 293.0621.

Optical rotation: $\left[\alpha\right]_{D}^{22}$ +37.9 (c 0.10, CHCl₃) for a sample with *ee* 98%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (96:4 n-Hexane/2-Propanol, 0.8 mL/min, 254 nm, $\tau_{major} = 39.2 \text{ min}$, $\tau_{minor} = 45.1 \text{ min}$).

(E)-2-(Hex-2-enoyl)thiophene-3-carbaldehyde (42d).

This compound was prepared by following the general procedure 1 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2921, 2854, 1673, 1648, 1611, 1366, 733. ¹H-NMR (400

MHz, CDCl₃): δ 10.57 (s, 1H), 7.67 (d, J = 5,1 Hz, 1H), 7.50 (dd, J = 5.1 and 0.8 Hz, 1H), 7.20 (dt, J = 15.2 and 7.0 Hz, 1H), 6.73 (dt, J = 15.2 and 1.5 Hz, 1H), 2.34 (dq, J = 7.3 and 1.5 Hz, 2H), 1.59 (sextet, J = 7.3 Hz, 2H), 1.00 (t, J = 7.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 187.3, 182.7, 151.9, 146.6, 144.5, 129.4, 128.5, 127.6, 34.7, 21.3, 13.7. HRMS (ESI): m/z calcd for C₁₁H₁₃O₂S (M+H)⁺: 209.0636. Found: 209.0618.

(*R*,*E*)-5-Butylidene-4-hydroxy-4*H*-cyclopenta[*b*]thiophen-6(5*H*)-one (43d).

This compound was isolated as Pale yellow oil. Following the general procedure **5**, 20 mg of **42d** afforded 18.4 mg of **43d** (92% yield). $R_f = 0.3$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3370, 2913, 1673, 1629,

1445, 1300, 1024, 786. ¹H-NMR (400 MHz, CDCl₃): δ 7.89 (d, J = 4.8 Hz, 1H), 7.28 (d, J = 4.8 Hz, 1H), 6.78 (t, J = 7.8 Hz, 1H), 5.60 (s, 1H), 2.57-2.40 (m, 2H), 1.77-1.52 (m, 2H), 1.01 (t, J = 7.4 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 183.6, 164.2, 144.0, 143.1, 140.6, 140.2, 123.3, 66.4, 30.8, 21.9, 14.0. HRMS (ESI): m/z calcd for C₁₁H₁₃O₂S (M+H)⁺: 209.0636. Found: 209.0625.

Optical rotation: $[\alpha]_D^{22}$ +24.1 (*c* 0.07, CHCl₃) for a sample with *ee* 91%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (95:5 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 17.8 \text{ min}, \tau_{minor} = 13.1 \text{ min}$).

(E)-2-(Dec-2-enoyl)thiophene-3-carbaldehyde (42e).

This compound was prepared by following the general procedure 1 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2943, 2879, 1677, 1654, 1621, 1429, 1024, 733. ¹H-NMR

(400 MHz, CDCl₃): δ 10.56 (s, 1H), 7.67 (d, J = 5.1 Hz, 1H), 7.50 (dd, J = 5.1 and 0.8 Hz, 1H), 7.20 (dt, J = 15.2 and 7.0 Hz, 1H), 6.73 (dt, J = 15.2 and 1.5 Hz, 1H), 2.35 (qd, J = 7.3 and 1.5 Hz, 2H), 1.56-1.54 (m, 2H), 1.38-1.29 (m, 8H), 0.90 (t, J = 7.3 Hz, 3H). ¹³C-NMR (100 MHz,

CDCl₃): § 187.3, 182.7, 152.2, 146.6, 144.5, 129.4, 128.4, 127.4, 32.8, 31.7, 29.2, 29.0, 28.0, 22.6, 14.0. **HRMS (ESI)**: m/z calcd for C₁₅H₂₁O₂S (M+H)⁺: 265.1262. Found: 265.1259.

(*R*,*E*)-4-Hydroxy-5-octylidene-4*H*-cyclopenta[*b*]thiophen-6(5*H*)-one (43e).

НÒ This compound was isolated as pale yellow oil. Following the general C₇H₁₅ procedure 5, 20 mg of 42e afforded 18.4 mg of 43e (92% yield). $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3380, 2927, 1670, 43e (*E*/*Z* = 11:1) 1629, 1423, 934, 786. ¹H-NMR (400 MHz, CDCl₃): δ 7.90 (d, J = 4.8 Hz, 1H), 7.29 (d, J = 4.8Hz, 1H), 6.81-6.77 (m, 1H), 5.61 (d, J = 6.9 Hz, 1H), 2.59-2.43 (m, 2H), 2.33 (d, J = 7.4 Hz, 1H), 1.61-1.50 (m, 2H), 1.46-1.25 (m, 8H), 0.89 (t, J = 7.1 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 183.6, 164.1, 144.1, 142.9, 140.9, 140.2, 123.3, 66.5, 31.7, 29.4, 29.1, 28.9, 28.6, 22.6, 14.1. **HRMS (ESI):** m/z calcd for C₁₅H₂₁O₂S (M+H)⁺: 265.1262. Found: 265.1262. **Optical rotation:** $\left[\alpha\right]_{D}^{22}$ +57.5 (c 0.10, CHCl₃) for a sample with *ee* 91%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (95:5 n-

Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 18.0 \text{ min}$, $\tau_{\text{minor}} = 12.3 \text{ min}$).

2-Cinnamovlthiophene-3-carbaldehvde (42f).

This compound was prepared by following the general procedure **1** and isolated as pale yellow solid. M.P = 91-92 °C. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2927, 2855, 1679, 1652, 1593, 1423, 1190, 762. ¹H-**NMR** (400 MHz, CDCl₃): δ 10.65 (s, 1H), 7.92 (d, J = 15.4 Hz, 1H), 7.72 (d, J = 5.1 Hz, 1H), 7.69-7.65 (m, 2H), 7.55 (dd, J = 5.1 and 0.8 Hz, 1H), 7.48-7.47 (m, 3H), 7.36 (d, J = 15.4 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 187.4, 182.4, 146.9, 146.3, 144.6, 134.1, 131.3, 129.5, 129.1(2C), 128.8(2C), 128.7, 123.2. **HRMS (ESI):** m/z calcd for C₁₄H₁₁O₂S (M+H)⁺: 243.0480. Found: 243.0456.

(*R*,*E*)-5-Benzylidene-4-hydroxy-4*H*-cyclopenta[*b*]thiophen-6(5*H*)-one (43f).

8.06 (d, J = 7.3 Hz, 2H), 7.53-7.44 (m, 4H), 7.43 (d, J = 4.8 Hz, 1H), 5.92 (d, J = 8.8 Hz, 1H), 5.13 (d, J = 8.9 Hz, 1H). ¹³C-NMR (100 MHz, (CD₃)₂CO): δ 183.8, 165.9, 143.0, 142.1, 140.3, 134.2, 133.8, 131.7(2C), 129.7, 128.6(2C), 123.8, 65.9. HRMS (ESI): m/z calcd for C₁₄H₁₁O₂S (M+H)⁺: 243.0479. Found: 243.0468.

Optical rotation: $[\alpha]_D^{22}$ +124.3 (*c* 0.23, CHCl₃) for a sample with *ee* 97%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (95:5 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 36.0 \text{ min}, \tau_{minor} = 28.6 \text{ min}$).

2-Cinnamoylnicotinaldehyde (42g).

This compound was prepared by following the general procedure **3** and isolated as a colorless solid. M.P = 78-79 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2926, 2852, 1696, 1671, 1600, 1575, 1333, 1033, 749.

¹**H-NMR** (400 MHz, CDCl₃): δ 10.58 (d, J = 0.6 Hz, 1H), 8.92 (dd, J = 4.7 and 1.7 Hz, 1H), 8.30 (dd, J = 7.8 and 1.8 Hz, 1H), 8.11 (d, J = 16.0 Hz, 1H), 7.96 (d, J = 16.0 Hz, 1H), 7.75 (dd, J = 6.9 and 2.9 Hz, 2H), 7.65 (ddd, J = 7.8, 4.7 and 0.6 Hz, 1H), 748-7.45 (m, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.9, 165.6, 156.5, 139.4, 134.6, 134.5, 132.2, 130.3, 130.1, 129.1, 125.3, 117.5, 110.1, 67.6, 56.3. HRMS (ESI): m/z calcd for C₁₅H₁₂NO₂ (M+H)⁺: 238.0868. Found: 243.0873.

(S,E)-6-Benzylidene-5-hydroxy-5H-cyclopenta[b]pyridin-7(6H)-one (43g).

This compound was isolated as pale yellow solid. Following the general procedure **5**, 15 mg of **42g** afforded 13.8 mg of **43g** (92% yield). M.P = 176-177 °C. $R_f = 0.2$ (Hexane/EtOAc = 1/1). IR (thin film, neat): v_{max}/cm^{-1} 3395, 2925, 2853, 1712, 1627, 1546, 1405, 1298, 947, 750. ¹H-NMR (400 MHz, (CD₃)₂SO): δ 8.86 (dd, J = 4.5 and 1.3 Hz, 1H), 8.27 (dd, J = 7.8 and 1.1 Hz, 1H), 8.10-8.08 (m, 2H), 7.74 (dd, J = 7.8 and 4.6 Hz, 1H), 7.65 (d, J = 1.3 Hz, 1H), 7.56-7.50 (m, 3H), 6.14 (d, J = 9.0 Hz, 1H), 5.90 (d, J = 9.0 Hz, 1H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 192.0, 153.8, 152.5, 148.7, 137.6, 137.3, 135.6, 134.1, 132.6(2C), 130.9, 129.2(2C), 128.9, 65.9. HRMS (ESI): m/z calcd for C₁₅H₁₂NO₂ (M+H)⁺: 238.0868. Found: 238.0862.

Optical rotation: $[\alpha]_D^{22}$ +136.0 (*c* 0.17, DMSO) for a sample with *ee* 99%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (85:15 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 47.9$ min, $\tau_{minor} = 37.5$ min).

(E)-2-(Hex-2-enoyl)benzaldehyde (42h).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max} /cm⁻¹ 2950, 2937, 2855, 1697, 1657, 1623, 1449, 737. ¹H-NMR

(400 MHz, CDCl₃): δ 10.12 (s, 1H), 7.98 (dd, J = 7.5 and 1.4 Hz, 1H), 7.69-7.61 (m, 2H), 7.57-7.55 (m, 1H), 6.74 (td, J = 15.8 and 6.8 Hz, 1H), 6.60 (td, J = 15.8 and 1.3 Hz, 1H), 2.31-2.25 (m, 2H), 1.57-1.47 (m, 2H), 0.95 (t, J = 7.4 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.8, 191.0, 152.9, 141.7, 135.4, 133.1, 130.7, 130.4, 129.3, 128.4, 34.8, 21.2, 13.7. HRMS (ESI): m/z calcd for C₁₃H₁₅O₂ (M+H)⁺: 203.1072. Found: 203.1083.

(E)-2-Butylidene-3-hydroxy-2,3-dihydro-1H-inden-1-one (43h).

This compound was isolated as pale yellow oil. Following the general procedure **4**, 25 mg of **42h** afforded 24 mg of **43h** (94% yield). $R_f = 0.3$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3398, 2923, 2850, 1694, 1643, 1606, 1445, 1105, 937. ¹H-NMR (**400 MHz, CDCl_3**): δ 7.80 (d, J = 7.7 Hz, 1H), 7.77-7.74 (m, 1H), 7.72-7.65 (m, 1H), 7.52-7.48 (m, 1H), 7.00-6.96 (m, 1H), 5.68 (s, 1H), 2.64-2.47 (m, 2H), 2.25 (s, 1H), 1.67-1.53 (m, 2H), 1.02 (t, J = 7.3 Hz, 3H). ¹³C-NMR (**100 MHz, CDCl_3**): δ 191.6, 151.3, 143.0, 139.6, 137.5, 135.2, 129.6, 126.0, 123.7, 68.7, 31.3, 21.9, 14.0. **HRMS (ESI)**: m/z calcd for C₁₃H₁₃O (M-OH)⁺: 185.0966. Found: 185.0982.

(E)-2-(dec-2-enoyl)benzaldehyde (42i).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2947, 2930, 2859, 1695, 1660, 1623, 1443, 737. ¹H-NMR

(400 MHz, CDCl₃): δ 10.12 (s, 1H), 7.98 (dd, J = 7.4 and 1.5 Hz, 1H), 7.69-7.60 (m, 2H), 7.57-7.55 (m, 1H), 6.74 (td, J = 15.8 and 6.8 Hz, 1H), 6.59 (td, J = 15.8 and 1.2 Hz, 1H), 2.32-2.26 (m, 2H), 1.51-1.44 (m, 2H), 1.30-1.28 (m, 8H), 0.89 (t, J = 6.8 Hz, 3H). ¹³C-NMR (100 MHz,

CDCl₃): δ 194.8, 191.0, 153.3, 141.7, 135.4, 133.1, 130.7, 130.2, 129.3, 128.3, 32.8, 31.6, 29.1, 29.0, 27.9, 22.6, 14.1. **HRMS (ESI):** m/z calcd for $C_{17}H_{23}O_2$ (M+H)⁺: 259.1698. Found: 259.1714.

(S,E)-3-Hydroxy-2-octylidene-2,3-dihydro-1*H*-inden-1-one (43i).

но_н This compound was isolated as pale yellow oil. Following the general C₇H₁₅ procedure 5, 23 mg of 42i afforded 21.4 mg of 43i (93% yield). $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3402, 2922, 2854, 43i (*E*/*Z* = 9:1) 1689, 1643, 1603, 1258, 753. ¹H-NMR (400 MHz, CDCl₃): δ 7.79-7.73 (m, 2H), 7.71-7.65 (m, 1H), 7.51-7.47 (m, 1H), 6.98 (td, J = 7.8 and 1.7 Hz, 1H), 5.68 (d, J = 7.6 Hz, 1H), 2.64-2.48 (m, 2H), 2.28 (d, J = 8.3 Hz, 1H), 1.63-1.48 (m, 2H), 1.43-1.27 (m, 8H), 0.90 (t, J = 7.0 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.6, 151.3, 143.4, 139.4, 137.5, 135.2, 129.6, 126.0, 123.7, 68.7, 31.7, 29.5, 29.4, 29.1, 28.6, 22.6, 14.1. **HRMS (ESI):** m/z calcd for C₁₇H₂₃O₂ (M+H)⁺: 259.1698. Found: 259.1698.

Optical rotation: $[\alpha]_D^{22}$ +18.0 (c 0.17, CHCl₃) for a sample with *ee* 98%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (95:5 n-Hexane/2-Propanol, 0.9 mL/min, 254 nm, $\tau_{major} = 36.0 \text{ min}, \tau_{minor} = 28.6 \text{ min}$).

(E)-2-(3-Cyclohexylacryloyl)benzaldehyde (42j).

This compound was prepared by following the general procedure 3 and isolated as colorless oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2942, 2927, 2872, 1696, 1662, 1620, 1427, 972, 737. ¹H-NMR (400 MHz, CDCl₃): δ 10.12 (s, 1H), 7.99-7.97 (m, 1H), 7.68-7.61 (m, 2H), 7.57-7.55 (m, 1H), 6.70 (dd, J = 16.0 and 6.4 Hz, 1H), 6.55 (dd, J = 16.0 and 1.0 Hz, 1H), 2.25-2.20 (m, 1H),

1.81-1.71 (m, 5H), 1.34-1.12 (m, 5H). ¹³C-NMR (100 MHz, CDCl₃): δ 195.1, 191.1, 157.9, 141.8, 135.4, 133.1, 130.7, 129.2, 128.4, 127.8, 41.0, 31.5(2C), 25.8, 25.6(2C). HRMS (ESI): m/z calcd for C₁₆H₁₉O₂ (M+H)⁺: 243.1385. Found: 243.1372.

(S,E)-2-(Cyclohexylmethylene)-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (43j).

This compound was isolated as colorless solid. Following the general procedure 5, 25 mg of 42j afforded 24.3 mg of 43j (97% yield). M.P = 110-111 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR

(thin film, neat): v_{max}/cm^{-1} 3400, 2926, 2851, 1698, 1650, 1606, 1448, 1258, 1105, 926, 747. ¹H-NMR (400 MHz, CDCl₃): δ 7.74 (t, J = 7.2 Hz, 2H), 7.70-7.65 (m, 1H), 7.48-7.45 (m, 1H), 6.81 (dd, J = 10.5 and 1.6 Hz, 1H), 5.68 (s, 1H), 2.86-2.78 (m, 1H), 2.24 (br s, 1H), 1.82-1.73 (m, 5H), 1.42-1.18

(m, 5H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.3, 151.3, 147.8, 137.6, 137.5, 135.2, 129.6, 126.0, 123.6, 68.6, 38.4, 32.1, 31.8, 25.8, 25.4, 25.3. **HRMS (ESI):** m/z calcd for C₁₆H₁₇O (M-OH)⁺: 225.1279. Found: 225.1268.

Optical rotation: $\left[\alpha\right]_{D}^{22}$ +15.5 (c 0.33, CHCl₃) for a sample with *ee* 94%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (95:5 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 23.1 \text{ min}$, $\tau_{minor} = 31.9 \text{ min}$).

2-Cinnamoylbenzaldehyde (42k).

CHO [] O 42k

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2927, 2851, 1698, 1660, 1621, 1574, 1340, 1118, 737. ¹H-NMR (400)

MHz, CDCl₃): δ 10.19 (s, 1H), 8.04-8.01 (m, 1H), 7.72-7.67 (m, 3H), 7.59-7.57 (m, 2H), 7.50 (d, J = 16.1 Hz, 1H), 7.44-7.41 (m, 3H), 7.25 (d, J = 16.1 Hz, 1H). ¹³C-NMR (100 MHz, **CDCl₃**): δ 194.3, 191.1, 147.0, 141.7, 135.5, 134.1, 133.3, 131.1, 131.0, 129.6, 129.0(2C), 128.6(2C), 128.4, 125.9. **HRMS (ESI):** m/z calcd for C₁₆H₁₃O₂ (M+H)⁺: 235.0759. Found: 235.0750.

(S,E)-2-Benzylidene-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (43k).

This compound was isolated as colorless solid. Following the general procedure **5**, 25 mg of **42k** afforded 24 mg of **43k** (95% yield). $M.P = 187-188 \ ^{\circ}C. R_{f} = 0.2$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3425, 2922, 2880, 1696, 1626, 1275, 1092, 750. ¹H-NMR (400 MHz, (CD₃)₂CO): δ 8.14-8.11 (m, 2H), 7.89-7.86 (m, 1H), 7.81-7.77 (m, 2H), 7.62-7.59 (m, 2H), 7.55-7.46 (m, 3H), 5.96 (dd, J = 9.0 and 1.4 Hz, 1H), 5.03 (d, J = 9.1 Hz, 1H). ¹³C-NMR (100 MHz, (CD₃)₂CO): δ . 191.9, 152.8, 138.4, 136.9, 135.8, 135.1, 134.5, 132.0(2C), 129.9, 129.3, 128.7(2C), 126.4, 122.8, 68.0. HRMS (ESI): m/z calcd for $C_{16}H_{11}O(M-OH)^+$: 219.0809. Found: 219.0804.

Optical rotation: $[\alpha]_D^{22}$ +130.3 (*c* 0.1, CHCl₃) for a sample with *ee* 98%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (95:5 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 23.6 \text{ min}, \tau_{minor} = 22.3 \text{ min}$).

(E)-2-(3-(4-Methoxyphenyl)acryloyl)benzaldehyde (42l).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2948, 2852, 1689, 1650, 1604, 1574, 1442, 1142, 766. ¹H-NMR (400 MHz, CDCl₃): δ 10.20 (s, 1H), 8.04-8.02 (m, 1H), 7.71-7.67 (m, 3H), 7.54 (d, J = 8.8 Hz, 2H), 7.47 (d, J = 16.0 Hz, 1H), 7.13 (d, J = 16.0 Hz, 1H), 6.95 (d, J = 8.8 Hz, 2H), 3.88 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.3, 191.2, 162.1, 147.2, 142.2, 135.4, 133.2, 130.8(2C), 130.5, 129.2, 128.3, 126.8, 123.7, 114.5(2C), 55.4. HRMS (ESI): m/z calcd for $C_{17}H_{15}O_3$ (M+H)⁺: 267.1021. Found: 267.1054.

(*S*,*E*)-3-Hydroxy-2-(4-methoxybenzylidene)-2,3-dihydro-1*H*-inden-1-one (43l).

This compound was isolated as pale yellow solid. Following the general procedure **5**, 20 mg of **42l** afforded 18.4 mg of **43l** (92% yield). M.P = 164-166 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3389, 2930, 2850, 1685, 1634, 1600, 1434, 1258, 1105, 786. ¹H-NMR

(400 MHz, (CD₃)₂CO): δ 8.10 (d, *J* = 8.8 Hz, 2H), 7.87 (d, *J* = 8.0 Hz, 1H), 7.79-7.75 (m, 2H), 7.59-7.55 (m, 2H), 7.09 (d, *J* = 8.8 Hz, 2H), 5.91 (d, *J* = 8.8 Hz, 1H), 4.91 (d, *J* = 9.2 Hz, 1H), 3.91 (s, 3H). ¹³C-NMR (100 MHz, (CD₃)₂CO): δ 191.8, 161.4, 152.7, 137.2, 135.9, 135.8, 134.8, 134.0(2C), 129.2, 127.1, 126.3, 122.7, 114.2(2C), 68.1, 54.9. HRMS (ESI): *m*/*z* calcd for C₁₇H₁₄O₃ (M)⁺: 266.0942. Found: 266.0936.

Optical rotation: $[\alpha]_D^{22}$ +145.0 (*c* 0.08, CHCl₃) for a sample with *ee* 98%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AD-H Column (90:10 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 28.9$ min, $\tau_{minor} = 30.7$ min).

(E)-2-(3-(Furan-2-yl)acryloyl)benzaldehyde (42m).

This compound was prepared by following the general procedure **3** and isolated as pale brown solid. M.P = 91-92 °C. $R_f = 0.2$ (Hexane/EtOAc = 9/1). IR (thin film, neat): v_{max}/cm^{-1} 2925,

2855, 1695, 1596, 1466, 1285, 1015, 737. ¹H-NMR (400 MHz, CDCl₃): δ 10.21 (s, 1H), 8.01-7.99 (m, 1H), 7.71-7.65 (m, 3H), 7.57 (d, J = 1.4 Hz, 1H), 7.33 (d, J = 15.6 Hz, 1H), 7.16 (d, J = 15.6 Hz, 1H), 6.75 (d, J = 3.5 Hz, 1H), 6.54 (dd, J = 3.5 and 1.8 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.3, 191.3, 150.9, 145.6, 141.7, 135.7, 133.2, 132.4, 131.0, 129.3, 128.4, 122.7, 117.2, 112.9. HRMS (ESI): m/z

(S,E)-2-(Furan-2-vlmethylene)-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (43m).

calcd for $C_{14}H_{11}O_3 (M+H)^+$: 227.0708. Found: 227.0709.

This compound was isolated as pale brown solid. Following the general procedure 5, 20 mg of 42m afforded 18 mg of 43m (90% yield). M.P = 150-151 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3378, 2923, 2852, 1693, 1626, 1467, 1021, 752. ¹H-NMR (400 MHz, CDCl₃): δ

7.90 (d, J = 7.7 Hz, 1H), 7.84 (dq, J = 7.6 and 0.8 Hz, 1H), 7.76-7.72 (m, 2H), 7.58-7.53 (m, 1H), 7.50 (d, J = 1.5 Hz, 1H), 6.98 (d, J = 3.5 Hz, 1H), 6.66 (dd, J = 3.5 Hz, 1H), 6.05 (d, J = 3.7Hz, 1H), 3.38 (d, J = 4.6 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.0, 157.2, 150.4, 146.1, 137.9, 135.7, 135.2, 129.6, 126.3, 123.6, 121.2, 118.9, 113.3, 68.8. HRMS (ESI): m/z calcd for $C_{14}H_{11}O_3 (M+H)^+$: 227.0708. Found: 227.0695.

Optical rotation: $[\alpha]_D^{22}$ +189.0 (*c* 0.07, CHCl₃) for a sample with *ee* 95%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (97:3 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 28.7 \text{ min}$, $\tau_{\text{minor}} = 32.5 \text{ min}$).

(*E*)-2-(Hex-2-enoyl)-4-methylbenzaldehyde (42n).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2961, 2931, 2872, 1694, 1660, 1616, 1305, 979, 825. ¹H-

NMR (400 MHz, CDCl₃): δ 10.04 (s, 1H), 7.86 (d, J = 7.9 Hz, 1H), 7.46-7.40 (m, 1H), 7.31-7.30 (m, 1H), 6.70 (td, J = 16.0 and 6.8 Hz, 1H), 6.55 (td, J = 16.0 and 1.4 Hz, 1H), 2.46 (s, 3H), 2.29-2.23 (m, 2H), 1.54-1.47 (m, 2H), 0.94 (t, J = 7.4 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 195.4, 190.6, 152.7, 144.5, 142.0, 132.8, 131.2, 130.7, 129.6, 128.8, 34.7, 21.7, 21.2, 13.7. **HRMS (ESI):** m/z calcd for C₁₄H₁₇O₂ (M+H)⁺: 217.1228. Found: 217.1221.

(E)-2-Butylidene-3-hydroxy-6-methyl-2,3-dihydro-1H-inden-1-one (43n).

ОН This compound was isolated as colorless oil. Following the general C_3H_7 procedure 4, 20 mg of 42n afforded 18.4 mg of 43n (92% yield). $R_f = 0.2$ Me (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3405, 2960, 2929, 43n (E/Z = 11:1)2872, 1700, 1651, 1489, 1285, 1153, 783. ¹H-NMR (400 MHz, CDCl₃): δ 7.64 (d, J = 7.8 Hz, 1H), 7.58 (d, J = 4.5 Hz, 1H), 7.51 (d, J = 7.9 Hz, 1H), 6.97-6.92 (m, 1H), 5.64 (s, 1H), 2.62-2.47 (m, 2H), 2,43 (s, 3H), 2.26 (br s, 1H), 1.61-1.58 (m, 2H), 1.01 (t, J = 7.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.8, 148.8, 142.6, 140.1, 139.8, 137.7, 136.4, 125.7, 123.7, 68.5, 31.2, 21.9, 21.3, 14.0. **HRMS (ESI):** m/z calcd for C₁₄H₁₅O (M-OH)⁺: 199.1122. Found: 199.1113.

2-Cinnamoyl-4-methylbenzaldehyde (420).

This compound was prepared by following the general procedure 3 and isolated as pale yellow solid. M.P = 190-191 $^{\circ}$ C. R_f = 0.4 (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3059, 2955, 2858, 1693, 1652, 1598,

1574, 1332, 1168, 1031, 772. ¹H-NMR (400 MHz, CDCl₃): δ 10.12 (s, 1H), 7.93 (d, J = 7.9 Hz, 1H), 7.59-7.58 (m, 1H), 7.48-7.46 (m, 2H), 7.44-7.41 (m, 4H), 7.21 (d, J = 16.1 Hz, 1H), 2.51 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.9, 190.7, 146.8, 144.6, 141.9, 134.2, 132.9, 131.5, 131.0, 129.9, 129.0(2C), 128.9, 128.6(2C), 126.3, 21.8. HRMS (ESI): m/z calcd for C₁₇H₁₅O₂ (M+H)⁺: 251.1072. Found: 251.1066.

(E)-2-Benzylidene-3-hydroxy-6-methyl-2,3-dihydro-1H-inden-1-one (430).

This compound was isolated as colorless solid. Following the general Ρh procedure 4, 22 mg of 420 afforded 19.5 mg of 430 (89% yield). M.P = 189-190 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3484, 2925, 1686, 1620, 1287, 1158, 1014, 785. ¹H-NMR (400 MHz, CDCl₃): δ 7.96-7.93 (m, 2H), 7.71 (d, J = 7.7 Hz, 1H), 7.58-7.55 (m, 2H), 7.54-7.43 (m, 4H), 5.91 (d, J = 6.5 Hz, 1H), 2.62 (d, J = 9.0 Hz, 1H), 2.42 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.9, 149.1, 140.0, 137.6, 137.5, 137.1, 136.6, 133.9, 131.9(2C), 130.4, 128.9(2C), 125.7, 123.7, 68.5, 21.3. HRMS (ESI): m/z calcd for C₁₇H₁₃O (M-OH)⁺: 233.0966. Found: 233.0957.

(E)-2-(Hex-2-enoyl)-5-methoxybenzaldehyde (42p).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2961, 2929, 2872, 1695, 1660, 1613, 1463, 1281,

1114, 978. ¹**H-NMR (400 MHz, CDCl₃):** δ 10.18 (s, 1H), 7.65 (dd, J = 8.5 and 2.0 Hz, 1H), 7.43-7.42 (m, 1H), 7.122 (dt, J = 8.5 and 2.8 Hz, 1H), 6.92-6.84 (m, 1H), 6.68 (dd, J = 15.7 and 1.1 Hz, 1H), 3.91 (d, J = 3.0 Hz, 3H), 2.29 (q, J = 7.4 Hz, 2H), 1.54 (qd, J = 7.4 and 2.5 Hz, 2H), 0.96 (td, J = 7.4 and 2.8 Hz, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 192.3, 191.5, 161.8, 151.8, 138.7, 133.9, 131.0, 129.0, 118.8, 112.4, 55.7, 34.8, 21.3, 13.7. **HRMS (ESI):** m/z calcd for C₁₄H₁₇O₃ (M+H)⁺: 233.1177. Found: 233.1159.

(S,E)-2-Butylidene-3-hydroxy-5-methoxy-2,3-dihydro-1*H*-inden-1-one (43p).

This compound was isolated as colorless solid. Following the general procedure **4**, 20 mg of **42p** afforded 18.8 mg of **43p** (94% yield). M.P = 97-99 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1}

 $\frac{1}{3385}, 2961, 2932, 2872, 1693, 1649, 1599, 1341, 1289, 1095, 797. {}^{1}\text{H-NMR} (400 \text{ MHz, CDCl_3}): \delta 7.74-7.72 (m, 1H), 7.18 (d,$ *J*= 2.1 Hz, 1H), 7.02-6.99 (m, 1H), 6.92-6.87 (m, 1H), 5.60 (s, 1H), 3.93 (s, 3H), 2.62-2.45 (m, 2H), 2.20 (br s, 1H), 1.69-1.59 (m, 2H), 1.02 (t,*J* $= 7.4 Hz, 3H). {}^{13}\text{C-NMR} (100 \text{ MHz, CDCl_3}): \delta 190.1, 165.6, 154.3, 141.5, 140.0, 130.8, 125.6, 117.6, 108.9, 68.7, 55.8, 31.1, 22.0, 14.0. 2-Cinnamoyl-5-methoxybenzaldehyde (42q).

This compound was prepared by following the general procedure **3** and isolated as pale yellow solid. M.P = 129-130 °C. $R_f = 0.5$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 2976, 2934, 1693, 1661, 1601,

1334, 1238, 1015, 769. ¹**H-NMR (400 MHz, CDCl₃):** δ 10.27 (d, J = 0.6 Hz, 1H), 7.79 (d, J = 8.5 Hz, 1H), 7.66 (d, J = 15.9 Hz, 1H), 7.63-7.61 (m, 2H), 7.49 (dd, J = 2.6 and 1.1 Hz, 1H), 7.45-7.43 (m, 3H), 7.34 (d, J = 15.9 Hz, 1H), 7.18 (ddd, J = 8.5, 2.7 and 0.8 Hz, 1H), 3.95 (d, J = 1.0 Hz, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 191.7, 191.5, 162.0, 138.9, 134.3, 134.0, 131.0,

130.9, 129.0(2C), 128.5(2C), 124.6, 118.9, 112.6, 55.8. **HRMS (ESI):** m/z calcd for C₁₇H₁₅O₃ (M+H)⁺: 267.1021. Found: 267.1032.

(S,E)-2-Benzylidene-3-hydroxy-5-methoxy-2,3-dihydro-1*H*-inden-1-one (43q).

164-165 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} ¹ 2955, 2858, 1685, 1611, 1369, 767, 733. ¹H-NMR (400 MHz, CDCl₃): δ 8.05-8.03 (m, 2H), 7.73 (d, J = 8.5 Hz, 1H), 7.50-7.46 (m, 4H), 7.30 (d, J = 2.3 Hz, 1H), 7.12 (dd, J = 8.5 and 2.3 Hz, 1H), 6.03 (d, J = 8.7 Hz, 1H), 5.78 (d, J = 8.5 Hz, 1H), 3.92 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): § 190.9, 165.6, 156.5, 139.4, 134.6, 134.5, 132.2(2C), 130.3, 130.1, 129.1(2C), 125.3, 117.5, 110.1, 67.6, 56.3. **HRMS (ESI):** m/z calcd for C₁₇H₁₅O₃ (M+H)⁺: 267.1021. Found: 267.1025.

Optical rotation: $\left[\alpha\right]_{D}^{22}$ +100.1 (c 0.27, CHCl₃) for a sample with *ee* 96%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (85:15 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{maior}} = 39.1$ min, $\tau_{\text{minor}} = 22.9$ min).

(E)-5-Methoxy-2-(3-(naphthalen-2-yl)acryloyl)benzaldehyde (42r).

This compound was prepared by following the general procedure **3**

This compound was isolated as pale yellow solid. Following the general

procedure 5, 20 mg of 42q afforded 18.6 mg of 43q (93% yield). M.P =

and isolated as pale brown solid. M.P = 135-136 $^{\circ}$ C. R_f = 0.4 (Hexane/ EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3056, 2980, 1689, 1651, 1595, 1361, 1237, 1017, 815. ¹H-NMR (400 MHz, CDCl₃): δ 10.30 (s, 1H), 8.01 (s, 1H), 7.90-7.77 (m, 6H), 7.58-7.54 (m, 2H), 7.52 (d, J = 2.6 Hz, 1H), 7.46 (d, J = 15.9 Hz, 1H), 7.22-7.19 (dd, J = 8.5 and 2.7 Hz, 1H), 3.96 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.7, 191.6, 162.1, 146.3, 138.9, 134.3, 134.2, 133.2, 131.8, 131.1, 131.0, 128.8, 128.7, 127.8, 127.6, 126.9, 124.7, 123.5, 118.9, 112.6, 55.8. **HRMS (ESI):** m/z calcd for C₂₁H₁₇O₃ (M+H)⁺: 317.1177. Found: 317.1172.

(S,E)-3-Hydroxy-5-methoxy-2-(naphthalen-2-ylmethylene)-2,3-dihydro-1*H*-inden-1-one (43r).

This compound was isolated as pale yellow solid. Following the general procedure 5, 20 mg of **42r** afforded 18.8 mg of **43r** (94% yield). M.P = 56-57 °C. $R_f = 0.2$ (Hexane/ EtOAc = 5/1). IR

(thin film, neat): v_{max}/cm^{-1} 2962, 2878, 1683, 1610, 1454, 1322, 737. ¹**H-NMR (400 MHz, (CD₃)₂SO):** δ 8.55 (s, 1H), 8.23 (dd, J = 8.7 and 1.6 Hz, 1H), 8.02-7.96 (m, 3H), 7.75 (d, J = 8.5 Hz, 1H), 7.63-7.58 (m, 3H), 7.34 (d, J = 2.3 Hz, 1H), 7.14 (dd, J = 8.5 and 2.3 Hz, 1H),

6.13 (d, J = 8.7 Hz, 1H), 5.92 (d, J = 8.6 Hz, 1H), 3.93 (s, 3H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 190.9, 165.6, 156.5, 139.7, 134.7, 133.7, 133.3, 133.1, 132.3, 130.2, 129.1, 128.55, 128.5, 128.0, 127.9, 127.1, 125.3, 117.5, 110.1, 67.7, 56.3. HRMS (ESI): m/z calcd for $C_{21}H_{15}O_2(M-OH)^+$: 299.1072. Found: 299.1089.

Optical rotation: $[\alpha]_D^{22}$ +14.2 (*c* 0.20, DMSO) for a sample with *ee* 92%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (85:15 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{maior}} = 51.3 \text{ min}$, $\tau_{\text{minor}} = 27.8 \text{ min}$).

2-Cinnamoyl-5-fluorobenzaldehyde (42s).

This compound was prepared by following the general procedure 3 and isolated as a colorless solid. M.P = 147-149 $^{\circ}$ C. R_f = 0.4 (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2950, 2858, 1694, 1657, 1600, 1574,

1168, 737. ¹H-NMR (400 MHz, CDCl₃): δ 10.20 (d, J = 2.6 Hz, 1H), 7.79 (dd, J = 8.5 and 5.0 Hz, 1H), 7.71 (dd, J = 8.7 and 2.7 Hz, 1H), 7.63-7.60 (m, 2H), 7.60 (d, J = 16.0 Hz, 1H), 7.48-7.37 (m, 3H), 7.40 (td, J = 8.7 and 2.6 Hz, 1H), 7.28 (d, J = 16.0 Hz, 1H). ¹³C-NMR (100 MHz, **CDCl₃**): δ 192.6, 189.9, 165.3, 162.8, 147.4, 138.7 (d, J = 7.3 Hz, 1C), 137.8 (d, J = 3.7 Hz, 1C), 134.0, 131.3, 131.1 (d, J = 8.1 Hz, 1C), 129.1(2C), 128.6(2C), 124.9, 120.0 (d, J = 87.5 Hz, 1C), 115.8 (d, J = 90.4 Hz, 1C). ¹⁹F-NMR (400 MHz, CDCl₃): δ -106.1. HRMS (ESI): m/z calcd for $C_{16}H_{12}FO_2$ (M+H)⁺: 255.0821. Found: 255.0842.

(S,E)-2-Benzylidene-5-fluoro-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (43s).

This compound was isolated as colorless solid. Following the general procedure 5, 20 mg of 42s afforded 18.8 mg of 43s (96% yield). M.P = 146-147 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3438, 3064, 3028, 1686, 1619, 1592, 1480, 1282, 1089, 767. ¹H-NMR (400 MHz, CDCl₃): δ 7.91 (dd, J = 7.4 and 2.0 Hz, 2H), 7.71 (dd, J = 8.4 and 5.1 Hz, 1H), 7.59 (d, J = 1.5 Hz, 1H), 7.50-7.45 (m, 4H), 7.15 (td, J = 8.6 and 2.3 Hz, 1H), 5.90 (d, J = 9.6 Hz, 1H), 2.93 (d, J = 10.0 Hz, 1H).

¹³C-NMR (100 MHz, CDCl₃): δ 191.2, 168.6, 166.0, 154.6 (d, J = 9.5 Hz, 1C), 138.2, 136.7, 133.4 (d, J = 131.2 Hz, 1C), 132.0(2C), 130.6, 129.0(2C), 126.1 (d, J = 10.3 Hz, 1C), 117.8 (d, J = 92.8 Hz, 1C), 112.9 (d, J = 90.4 Hz, 1C), 68.4. ¹⁹F-NMR (400 MHz, CDCl₃): δ -100.3. **HRMS (ESI):** m/z calcd for C₁₆H₁₀FO (M-OH)⁺: 237.0715. Found: 237.0723.

Optical rotation: $\left[\alpha\right]_{D}^{22}$ +121.1 (c 0.30, CHCl₃) for a sample with ee >99%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (85:15 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 13.4 \text{ min}$, $\tau_{\text{minor}} = 10.6 \text{ min}$).

(E)-1-(2-Acetylphenyl)-3-phenylprop-2-en-1-one (42t).

`Ме Ph [] 0 42t

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc =5/1). IR (thin film, neat): v_{max}/cm^{-1} 3062, 1682, 1650, 1597, 1490, 1263, 1019, 761. ¹H-NMR (400) **MHz**, **CDCl**₃): δ 7.78-7.76 (m, 1H), 7.61-7.60 (m, 2H), 7.55-7.52 (m, 3H), 7.39-7.37 (m, 3H), 7.34 (d, J = 16.2 Hz, 1H), 7.13 (d, J = 16.4 Hz, 1H), 2.57 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 200.1, 195.9, 145.0, 140.1, 138.8, 134.4, 131.6, 130.6, 130.3, 128.9(2C), 128.7, 128.4(2C), 128.1, 126.2, 28.3. **HRMS (ESI):** m/z calcd for $C_{17}H_{15}O_2 (M+H)^+$: 251.1072. Found: 251.1065.

(E)-2-Benzylidene-3-hydroxy-3-methyl-2,3-dihydro-1H-inden-1-one (43t).

.OH This compound was isolated as pale yellow solid. Following the general Ph procedure 4, 20 mg of 42s afforded 18 mg of 43s (90% yield). M.P = 147-148 ^oC. $R_f = 0.3$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3376, 2923, 43t (E/Z = 13:1) 2853, 1693, 1621, 1465, 1232, 737. ¹H-NMR (400 MHz, CDCl₃): δ 8.13 (dd, J = 7.9 and 1.3 Hz, 2H), 7.84-7.79 (m, 1H), 7.78-7.71 (m, 2H), 7.63 (s, 1H), 7.50-7.44 (m, 4H), 2.80 (s, 1H), 1.78 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.4, 156.7, 141.1, 137.5, 135.6, 135.2, 133.6, 132.7(2C), 130.0, 129.4, 128.6(2C), 123.7, 123.5, 74.9, 24.5. HRMS (ESI): m/z calcd for C₁₇H₁₃O (M-OH)⁺: 233.0966. Found: 233.0968.

(E)-1-(2-Benzoylphenyl)-3-(furan-2-yl)prop-2-en-1-one (42u).

This compound was prepared by following the general procedure 3 and isolated as pale yellow solid. M.P = 177-178 °C. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3043, 2958, 1676, 1663, 1609, 1492, 1024, 763. ¹H-NMR (400 MHz, CDCl₃): δ 7.92-7.90 (m, 1H),

7.80-7.78 (m, 2H), 7.64-7.62 (m, 2H), 7.54-7.51 (m, 3H), 7.49-7.44 (m, 2H), Ρh 7.34 (d, J = 15.6 Hz, 1H), 7.20 (d, J = 15.6 Hz, 1H), 6.65 (J = 3.4 Hz, 1H), 6.49 (dd, J = 3.4 and 1.8 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.5, 0 **42u** 190.9, 151.2, 145.2, 140.9, 138.9, 137.2, 132.9, 131.6, 131.4, 129.8, 129.5(2C), 128.7, 128.6, 128.4(2C), 120.5, 116.7, 112.7. **HRMS (ESI):** m/z calcd for $C_{20}H_{15}O_3$ (M+H)⁺: 303.1021. Found: 303.1015.

(E)-2-(Furan-2-ylmethylene)-3-hydroxy-3-phenyl-2,3-dihydro-1H-inden-1-one (43u).

This compound was isolated as pale yellow semi solid. Following the general procedure 4, 20 mg of 42u afforded 19 mg of 43u (95% yield). $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3353, 2919, 2851, 1682, 1616, 1465, 1237, 752. ¹H-NMR (400 MHz, CDCl₃): δ 7.88 (d, J = 7.6

Hz, 1H), 7.63-7.52 (m, 5H), 7.46 (td, J = 7.2 and 1.3 Hz, 1H), 7.41 (d, J = 1.8 Hz, 1H), 7.30-7.26 (m, 2H), 7.22-7.18 (m, 1H), 6.82 (d, J = 3.5 Hz, 1H), 6.45 (dd, J = 3.5 and 1.8 Hz, 1H), 4.02 (s, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.4, 155.2, 150.2, 145.9, 144.5, 139.7, 135.77, 135.7, 129.2, 128.4(2C), 127.1, 125.1, 124.8(2C), 123.5, 120.6, 119.5, 113.1, 78.7. HRMS (ESI): m/z calcd for C₂₀H₁₃O₂ (M-OH)⁺: 285.0915. Found: 285.0910.

(E)-1-(3-Acetylpyridin-2-yl)-3-phenylprop-2-en-1-one (42v).

This compound was prepared by following the general procedure 3 and isolated as a colorless solid. M.P = 102-104 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2927, 2859, 1712, 1667, 1621, 1365, 1216, 757. ¹**H-NMR** (400 MHz, CDCl₃): δ 8.80 (dd, J = 4.8 and 1.6 Hz, 1H), 8.10 (d, J = 16.1 Hz, 1H),

7.78 (dd, J = 7.8 and 1.6 Hz, 1H), 7.73-7.69 (m, 2H), 7.56 (dd, J = 7.7 and 4.7 H, 3H), 2.58 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 202.3, 189.9, 151.8, 149.6, 146.0, 138.9, 134.7(2C), 130.9, 129.0(2C), 128.9(2C), 126.1, 121.2, 30.4. **HRMS (ESI):** m/z calcd for C₁₆H₁₄NO₂ (M+H)⁺: 252.1024. Found: 252.1016.

(E)-6-Benzylidene-5-hydroxy-5-methyl-5H-cyclopenta[b]pyridin-7(6H)-one (43y).

This compound was isolated as colorless solid. Following the general procedure 4, 20 mg of 42v afforded 18.5 mg of 43v (92% yield) M.P = 219-220 °C. $R_f = 0.2$ (Hexane/EtOAc = 1/2). IR

(thin film, neat): v_{max}/cm⁻¹ 3367, 2924, 2851, 1713, 1621, 1311, 764. ¹H-NMR (**400 MHz, CDCl₃**): δ 8.73-8.72 (m, 1H), 8.20 (dd, *J* = 7.6 and 1.7 Hz, 2H), 7.70 (s, 1H), 7.56 (dd, J = 7.8 and 4.6 Hz, 1H), 7.50-7.47 (m, 3H), 3.42 (brs, 1H), 1.78 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.2, 152.4, 152.0, 151.6, 139.5,

139.3, 133.2, 133.0(2C), 132.8, 130.6, 128.7(2C), 128.6, 73.3, 24.2. HRMS (ESI): m/z calcd for $C_{16}H_{12}NO (M-OH)^+$: 234.0918. Found: 234.0903.

2-(3-Methylbut-2-enoyl)benzo[b]thiophene-3-carbaldehyde (42w).

This compound was prepared by following the general procedure 1 and isolated as colorless oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2965, 2913, 1672, 1660, 1615, 1421, 1155, 733. ¹H-NMR (400)

MHz, CDCl₃): δ 10.67 (s, 1H), 8.76-8.73 (m, 1H), 7.87-7.85 (m, 1H), 7.53-7.51 (m, 2H), 6.70-6.69 (m, 1H), 2.33 (d, J = 0.8 Hz, 3H), 2.09 (d, J = 0.9 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 188.3, 184.5, 162.0, 151.9, 138.7, 136.6, 136.2, 127.7, 126.6, 122.8, 122.1, 28.4, 21.7. HRMS (ESI): m/z calcd for C₁₄H₁₃O₂S (M+H)⁺: 245.0636. Found: 245.0642.

1-Hydroxy-2-(propan-2-ylidene)-1*H*-benzo[*b*]cyclopenta[*d*]thiophen-3(2*H*)-one (43w).

This compound was isolated as colorless solid. Following the general Ме procedure 4, 20 mg of 42w afforded 18.8 mg of 43w (94% yield). M.P = 168-169 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3400, 2917, 1678, 1633, 1427, 1267, 1110, 743. ¹H-NMR (400 MHz, CDCl₃): δ 8.11-8.08 (m, 1H), 7.89-7.87 (m, 1H), 7.51-7.45 (m, 2H), 5.75 (d, J = 8.5 Hz, 1H), 2.40 (d, J = 9.6 Hz, 1H),

2.34 (s, 3H), 2.21 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 186.2, 157.1, 153.1, 147.4, 145.7, 136.3, 133.4, 127.9, 125.3, 124.5, 124.2, 67.8, 23.8, 20.5. HRMS (ESI): m/z calcd for C₁₄H₁₁OS (M-OH)⁺: 227.0530. Found: 227.0517.

(E)-2-(3,7-Dimethylocta-2,6-dienoyl)benzo[b]thiophene-3-carbaldehyde (42x).

This compound was prepared by following the general procedure 1 and isolated as colorless oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2968, 2873, 1678, 1661, 1614, 1204,

1085, 760. ¹H-NMR (400 MHz, CDCl₃): δ 10.68 (s, 1H), 8.77-8.74 (m, 1H), 7.88-7.86 (m, 1H),

7.55-7.51 (m, 2H), 6.95-6.68 (m, 1H), 5.22-5.18 (m,1H), 2.75 (t, J = 8.0 Hz, 2H), 2.32 (d, J = 0.8 Hz, 3H), 2.37-2.24 (m, 2H), 1.74 (s, 3H), 1.66 (s, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 188.3, 184.7, 165.6, 152.1, 138.8, 136.7, 136.1, 133.1, 127.7, 126.8, 127.7, 123.2, 122.6, 122.1, 41.7, 28.8, 25.8, 20.5, 17.8. **HRMS (ESI):** m/z calcd for C₁₉H₂₁O₂S (M+H)⁺: 313.1262. Found: 313.1280.

(*E*)-1-Hydroxy-2-(6-methylhept-5-en-2-ylidene)-1*H*-benzo[*b*]cyclopenta[*d*]thiophen-3(2*H*)one (43x).

This compound was isolated as colorless solid. Following the general procedure **4**, 30 mg of **42x** afforded 24.6 mg of **43x** (82% yield). M.P = 103-104 °C. $R_f = 0.4$ (Hexane/EtOAc = 5/1). **IR (thin film, neat):**

 v_{max}/cm^{-1} 3401, 2967, 2919, 2855, 1682, 1629, 1523, 1375, 1266, 1111, 743. ¹H-NMR (400 MHz, CDCl₃): δ 8.10-8.07 (m, 1H), 7.88-7.85 (m, 1H), 7.50-7.46 (m, 2H), 5.75 (s, 1H), 5.23-5.11 (m, 1H), 2.95-2.88 (m, 1H), 2.78-2.50 (m, 2H), 2.20 (s, 3H), 1.69 (s, 3H), 1.65 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.6, 157.1, 156.1, 147.3, 145.8, 136.4, 133.4, 132.4, 127.9, 125.3, 124.4, 124.2, 123.5, 67.8, 33.6, 27.1, 25.7, 21.8, 17.6. HRMS (ESI): *m/z* calcd for C₁₉H₁₉OS (M+H)⁺: 295.1156. Found: 295.1143.

2-(3-Methylbut-2-enoyl)thiophene-3-carbaldehyde (42y).

This compound was prepared by following the general procedure 1 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2965, 2888, 1678, 1653, 1622, 1342, 1267, 737. ¹H-NMR (400 MHz,

CDCl₃): δ 10.58 (s, 1H), 7.61 (d, J = 5.1 Hz, 1H), 7.42 (dd, J = 5.1 and 0.8 Hz, 1H), 6.61-6.59 (m, 1H), 2.29 (d, J = 1.3 Hz, 3H), 2.05 (d, J = 1.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 187.6, 183.2, 160.7, 148.3, 144.0, 128.6, 128.2, 122.3, 28.5, 21.5. HRMS (ESI): m/z calcd for C₁₀H₁₁O₂S (M+H)⁺: 195.0479. Found: 195.0481.

(R)-4-Hydroxy-5-(propan-2-ylidene)-4H-cyclopenta[b]thiophen-6(5H)-one (43y).

This compound was isolated as colorless solid. Following the general procedure **5**, 25 mg of **42y** afforded 22 mg of **43y** (80% yield). M.P = 138-140 °C. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3377, 2917, 1676, 1634, 1435, 1299, 1118, 786. ¹H-NMR (400 MHz,

CDCl₃): δ 7.80 (d, J = 4.8 Hz, 1H), 7.23 (d, J = 4.8 Hz, 1H), 5.50 (d, J = 7.0 Hz, 1H), 2.49 (d, J = 8.0 Hz, 1H), 2.30 (s, 3H), 2.14 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.1, 162.1, 153.0, 145.4, 138.8, 137.1, 123.1, 67.6, 23.8, 20.4. **HRMS (ESI):** m/z calcd for C₁₀H₉OS (M-OH)⁺: 177.0374. Found: 177.0372.

Optical rotation: $\left[\alpha\right]_{D}^{22}$ +8.7 (c 0.10, CDCl₃) for a sample with *ee* 80%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (90:10 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 13.3 \text{ min}$, $\tau_{\text{minor}} = 9.5 \text{ min}$).

(E)-2-(3-Phenylbut-2-enoyl)thiophene-3-carbaldehyde (42z).

This compound was prepared by following the general procedure 1 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2930, 2856, 1680, 1657, 1594, 1433, 1196, 737. ¹H-NMR (400 MHz, **CDCl₃**): δ 10.66 (s, 1H), 7.67 (d, J = 5.1 Hz, 1H), 7.60-7.56 (m, 2H), 7.48-7.43 (m, 4H), 7.05-7.04 (m, 1H), 2.71 (d, J = 1.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.3, 187.5, 158.7, 144.1, 142.0, 129.8, 128.9, 128.8(2C), 128.7, 126.6(2C), 126.2, 122.7, 19.2. HRMS (ESI): *m/z* calcd for $C_{15}H_{13}O_2S$ (M+H)⁺: 257.0636. Found: 257.0644.

(E)-4-Hydroxy-5-(1-phenylethylidene)-4H-cyclopenta[b]thiophen-6(5H)-one (43z).

This compound was isolated as pale yellow oil solid. Following the general

procedure 4, 15 mg of 42z afforded 14 mg of 43z (94% yield). $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3370, 2922, 2855 1685, 1622, 1429, 1130, 1024, 776. ¹H-NMR (400 MHz, CDCl₃): δ 8.12 (d, J = 7.2 Hz, 1H), 7.85-7.83 (m, 1H), 7.51-7.47 (m, 2H), 7.42-7.37 (m, 3H), 5.65 (s, 1H), 2.71 (s, 3H) 2.05 (brs, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.1, 161.8, 151.6, 139.2, 130.1, 129.1(2C), 128.4, 127.9, 127.2, 126.7(2C), 123.2, 65.4, 20.7. **HRMS (ESI)**: m/z calcd for C₁₅H₁₁OS (M-OH)⁺: 239.0530. Found: 239.0543.

2-(2-Cyclohexylideneacetyl)thiophene-3-carbaldehyde (42aa).

This compound was prepared by following the general procedure 1 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). IR (thin film, **neat**): v_{max}/cm^{-1} 2943, 2876, 1670, 1656, 1619, 1119, 760. ¹H-NMR (400 MHz, CDCl₃): δ 10.59 (s, 1H), 7.62 (d, J = 5.1 Hz, 1H), 7.43 (dd, J = 5.1 and 0.8 Hz, 1H), 6.51 (t, J = 1.0 Hz, 1H), 2.89 (t, J = 6.1 Hz, 2H), 2.33 (td, J = 6.2 and 0.9 Hz, 2H), 1.76-1.65 (m, 6H). ¹³C-NMR (**100 MHz, CDCl₃**): δ 187.6, 183.9, 167.2, 148.4, 143.9, 128.8, 128.2, 119.7, 38.5, 30.8, 28.8, 28.0, 26.1. **HRMS (ESI):** m/z calcd for C₁₃H₁₅O₂S (M+H)⁺: 235.0792. Found: 235.0801.

5-Cyclohexylidene-4-hydroxy-4H-cyclopenta[b]thiophen-6(5H)-one (43aa).

This compound was isolated as colorless solid. Following the general procedure 4, 20 mg of 42aa afforded 18 mg of 43aa (90% yield). M.P = 85-87 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3372, 2923, 1679, 1630, 1449, 1298, 786. ¹H-NMR (400 MHz, CDCl₃): δ 7.81 (d, J = 4.8 Hz, 1H), 7.24 (d, 4.8 Hz, 1H), 5.58 (d, J = 6.8 Hz, 1Hz), 3.14-3.09 (m, 2H), 2.63-2.57 (m, 1H), 2.54-2.47 (m, 1H), 2.02 (br s, 1H), 1.82-1.65 (m, 6H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.3, 161.6, 160.8, 145.9, 138.7, 134.4, 123.1, 67.3, 33.4, 28.9, 28.6, 28.4, 26.2. HRMS (ESI): m/z calcd for C₁₃H₁₃OS (M-OH)⁺: 217.0687. Found: 217.0678.

2-(3-Methylbut-2-enoyl)nicotinaldehyde (42ab).

This compound was prepared by following the general procedure 3 and isolated as colorless oil. $R_f = 0.3$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm⁻¹ 2925, 2854, 1697, 1664, 1609, 1442, 1274, 1015, 750. ¹H-NMR (400

MHz, CDCl₃): δ 10.46 (s, 1H), 8.84 (dd, J = 4.7 and 1.7 Hz, 1H), 8.24 (dd, J = 7.8 and 1.7 Hz, 1H), 7.58 (dd, J = 7.6 and 4.9 Hz, 1H), 7.29-7.27 (m, 1H), 2.37 (d, J = 1.0 Hz, 3H), 2.13 (d, J = 1.0 Hz, 3H), 1.0 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.3, 190.7, 162.0, 157.2, 151.7, 136.3, 133.0, 126.0, 120.7, 28.6, 21.6. **HRMS (ESI):** m/z calcd for C₁₁H₁₂NO₂ (M+H)⁺: 190.0868 Found: 190.0859.

(S)-5-Hydroxy-6-(propan-2-ylidene)-5H-cyclopenta[b]pyridin-7(6H)-one (43ab).

1.2 Hz, 1H), 8.12 (dd, J = 7.8 and 0.8 Hz, 1H), 7.49 (dd, J = 7.8 and 4.6 Hz, 1H), 5.64 (s, 1H), 2.50 (s, 3H), 2.27 (s, 3H). ¹³C-NMR (100 MHz, (CDCl₃): δ 190.8, 158.7, 155.0, 152.2, 144.5, 134.8, 132.8, 127.7, 68.0, 24.2, 21.6. **HRMS (ESI):** m/z calcd for C₁₁H₁₀NO (M-OH)⁺: 172.0762. Found: 172.0761.

Optical rotation: $[\alpha]_D^{22}$ +8.6 (c 0.17, CHCl₃) for a sample with *ee* 85%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (85:15 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 22.7 \text{ min}$, $\tau_{\text{minor}} = 17.4 \text{ min}$).

(E)-2-(3-Phenylbut-2-enoyl)nicotinaldehyde (42ac).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2923, 2852, 1697, 1665, 1588, 1446, 1107, 758. ¹H-NMR (400) **MHz, CDCl₃**): δ 10.55 (d, J = 3.1 Hz, 1H), 8.86-8.84 (m, 1H), 8.27-8.24 (m, 1H), 7.83-7.82 (m, 1H), 7.83 (m, 1H), 7.83-7.82 (m, 1H), 7.83 (m, 1H), 7.83 (m, 1 1H), 7.68-7.66 (m, 2H), 7.62-7.58 (m, 1H), 7.46-7.44 (m, 3H), 2.77 (d, J = 2.4 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.3, 191.1, 159.2, 157.0, 151.7, 142.4, 136.3, 133.1, 129.7, 128.6(2C), 126.8(2C), 126.1, 121.0, 19.1. **HRMS (ESI):** m/z calcd for C₁₆H₁₄NO₂ (M+H)⁺: 252.1024. Found: 252.1018.

(E)-5-Hydroxy-6-(1-phenylethylidene)-5H-cyclopenta[b]pyridin-7(6H)-one (43ac).

ОН This compound was isolated as pale yellow solid. Following the general Ph procedure 4, 15 mg of 42ac afforded 12.5 mg of 43ac (84% yield).. M.P = 199-Мe 201 °C. $R_f = 0.2$ (Hexane/EtOAc = 1/2). IR (thin film, neat): v_{max}/cm^{-1} 3456, 43ac (*E*/*Z* = 7:1) 2923, 2856, 1738, 1617, 1365, 1216, 757. ¹H-NMR (400 MHz, CDCl₃): δ 8.84 (d, J = 4.5 Hz, 1H), 8.02 (d, J = 7.8 Hz, 1H), 7.54-7.49 (m, 2H), 7.47-7.40 (m, 3H), 7.33-7.31 (m, 1H), 5.75 (s, 1H), 2.80 (d, J = 0.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.7, 156.2, 155.1, 152.4, 144.4, 141.8, 134.8, 129.2(2C), 128.8, 128.0, 127.4, 126.6(2C), 67.5, 21.7. HRMS (ESI): m/z calcd for C₁₆H₁₂NO (M-OH)⁺: 234.0918. Found: 234.0900.

2-(2-Cyclohexylideneacetyl)nicotinaldehyde (42ad).

This compound was prepared by following the general procedure 3 and isolated as colorless oil. $R_f = 0.2$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2969, 2854, 1698, 1667, 1615,

1133, 1024, 767. ¹H-NMR (400 MHz, CDCl₃): δ 10.55 (d, J = 3.1 Hz, 1H), 8.86-8.84 (m, 1H), 8.27-8.24 (m, 1H), 7.83-7.82 (m, 1H), 7.68-7.66 (m, 1H), 2.92 (t, J = 5.6 Hz, 2H), 2.43-2.40 (m, 2H), 1.81-1.76 (m, 6H). ¹³C-NMR (100) MHz, CDCl₃): δ 191.3, 191.1, 159.2, 157.0, 151.7, 142.4, 136.5, 132.3, 120.5, 38.5, 30.6, 28.8, 28.1, 28.0. **HRMS (ESI):** m/z calcd for C₁₄H₁₆NO₂ (M+H)⁺: 230.1181. Found: 230.1179.

6-Cyclohexylidene-5-hydroxy-5H-cyclopenta[b]pyridin-7(6H)-one (43ad).

This compound was isolated as colorless solid. Following the general procedure 4, 20 mg of 42ad afforded 18.2 mg of 43ad (91% yield). M.P =199-201 °C. $R_f = 0.2$ (Hexane/EtOAc = 1/2). IR (thin film, neat): v_{max}/cm^{-1}

3367, 2924, 2851, 1713, 1621, 1311, 764. ¹H-NMR (400 MHz, CDCl₃): δ 8.85 (d, J = 4.6 Hz, 1H), 8.08 (d, J = 7.8 Hz, 1H), 7.57-7.55 (m, 1H), 5.81 (s, 1H), 3.45-3.40 (m, 2H), 2.75-2.67 (m, 2H), 2.01 (s, 1H), 1.81-1.65 (m, 6H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.9, 158.1, 154.5, 151.2, 144.5, 134.8, 131.8, 127.6, 68.7, 38.9, 31.1, 28.3, 28.0, 27.9. HRMS (ESI): m/z calcd for C₁₄H₁₄NO (M-OH)⁺: 212.1075. Found: 212.1067.

(E)-2-(2-(Chroman-4-ylidene)acetyl)nicotinaldehyde (42ae).

This compound was prepared by following the general procedure 3 and isolated as a pale yellow solid. M.P = 100-101 $^{\circ}$ C. R_f = 0.4 (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2929, 2857, 1697, 1674, 1601, 1570,

1426, 1033, 743. ¹H-NMR (400 MHz, CDCl₃): δ 10.53 (d, J = 0.5 Hz, 1H), 8.88 (dd, J = 4.7and 1.7 Hz, 1H), 8.25 (dd, J = 7.8 and 1.7 Hz, 1H), 8.08 (t, J = 1.7 Hz, 1H), 7.92 (dd, J = 8.1 and 1.5 Hz, 1H), 7.62 (ddd, J = 7.8, 4.7 and 0.6 Hz, 1H), 7.37 (ddd, J = 8.4, 7.1 and 1.6 Hz, 1H), 7.01 (ddd, J = 8.2, 7.4 and 1.2 Hz, 1H), 6.95 (dd, J = 8.3 and 1.2 Hz, 1H), 4.32 (t, J = 6.2 Hz, 2H), 3.57 (td, J = 6.2 and 1.8 Hz, 2H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.3, 190.7, 157.9, 156.9, 151.6, 151.1, 136.4, 133.2, 132.9, 126.2, 125.2, 121.2, 121.1, 118.4, 113.4, 65.6, 27.8. HRMS (ESI): m/z calcd for C₁₇H₁₄NO₃ (M+H)⁺: 280.0973. Found: 280.0962.

(E)-6-(Chroman-4-ylidene)-5-hydroxy-5H-cyclopenta[b]pyridin-7(6H)-one (43ae).

This compound was isolated as pale yellow solid. Following the general procedure 4, 15 mg of **42ae** afforded 12.1 mg of **43ae** (81% yield). M.P = 121-122 °C. $R_f = 0.2$ (Hexane/EtOAc = 1/2).

IR (thin film, neat): v_{max}/cm⁻¹ 3360, 2924, 2857, 1711, 1625, 1333, 756. ¹H-**NMR (400 MHz, CDCl₃):** δ 8.84 (d, J = 4.2 Hz, 1H), 8.17 (ddd, J = 12.0, 8.0 and 1.3 Hz, 2H), 7.56 (dd, J = 7.8 and 4.7 Hz, 1H), 7.40 (ddd, J = 8.4, 7.1 and 1.5 Hz, 1H), 7.10-7.08 (m, 1H), 6.95 (dd, J = 8.3 and 1.2 Hz, 1H), 6.05 (s, 1H), 4.35-4.28 (m, 2H), 3.83-3.81 (m, 1H), 3.85-3.61 (m, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ

192.1, 157.9, 154.5, 152.4, 147.6, 144.7, 134.5, 133.0, 130.2, 129.2, 127.9, 121.0, 120.5, 118.1, 68.1, 66.0, 26.1. **HRMS (ESI):** m/z calcd for C₁₇H₁₂NO₂ (M-OH)⁺: 262.0868. Found: 262.0882.

2-(3-Methylbut-2-enoyl)benzaldehyde (42af).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, **neat):** v_{max}/cm^{-1} 2914, 2849, 1695, 1650, 1439, 1367, 767. ¹H-NMR (400) **MHz, CDCl₃**): δ 10.23 (s, 1H), 7.94-7.92 (m, 1H), 7.68-7.60 (m, 3H), 6.59 (pentet, J = 1.2 Hz, 1H), 2.26 (d, J = 0.9 Hz, 3H), 2.04 (d, J = 1.1 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.1, 191.7, 159.4, 143.6, 135.8, 132.9, 130.9, 128.7, 128.1, 123.0, 28.1, 21.3. HRMS (ESI): m/z calcd for $C_{12}H_{13}O_2$ (M+H)⁺: 189.0915. Found: 189.0909.

(S)-3-Hydroxy-2-(propan-2-ylidene)-2,3-dihydro-1*H*-inden-1-one (43af).

This compound was isolated as colorless solid. Following the general procedure **5**, 20 mg of **42af** afforded 18.6 mg of **43af** (93% yield). M. P = 107-108 $^{\circ}$ C. R_f =

0.2 (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3453, 2919, 1680, 1632, 1276, 749. ¹H-NMR (400 MHz, CDCl₃): δ 7.72-7.70 (m, 2H), 7.66-7.63 (m, 1H), 7.48-7.43 (m, 1H), 5.59 (s, 1H), 2.35 (s, 3H), 2.26 (br s, 1H), 2.20 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.6, 156.0, 149.9, 138.7, 134.6, 134.0, 129.4, 125.8, 123.3, 70.0, 24.2, 21.0. HRMS (ESI): m/z calcd for C₁₂H₁₁O (M-OH)⁺: 171.0809. Found: 171.0804.

Optical rotation: $\left[\alpha\right]_{D}^{22}$ +7.4 (c 0.17, CHCl₃) for a sample with *ee* 71%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (96:4 n-Hexane/2-Propanol, 0.8 mL/min, 254 nm, $\tau_{\text{maior}} = 11.3 \text{ min}, \tau_{\text{minor}} = 8.4 \text{ min}$).

(E)-2-(3-phenylbut-2-enoyl)benzaldehyde (42ag).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm⁻¹ 2957, 2922, 1695, 1661, 1592, 1446, 1377, 1215, 757. ¹H-NMR (400

MHz, CDCl₃): δ 10.31 (s, 1H), 7.98 (dd, *J* = 7.3 and 1.6 Hz, 1H), 7.77-7.75 (m, 1H), 7.70-7.64 (m, 2H), 7.59-7.57 (m, 2H), 7.44-7.43 (m, 3H), 7.02 (d, J = 1.0 Hz, 1H), 2.69 (d, J = 0.7 Hz, 3H).¹³C-NMR (100 MHz, CDCl₃): δ 193.2, 191.8, 157.5, 143.6, 142.1, 135.9, 133.0, 131.2, 129.6, 129.0, 128.7(2C), 128.6, 126.6(2C), 123.3, 19.0. HRMS (ESI): m/z calcd for C₁₇H₁₅O₂ (M+H)⁺: 251.1072. Found: 251.1068.

(E)-3-Hydroxy-2-(1-phenylethylidene)-2,3-dihydro-1H-inden-1-one (43ag).

OН This compound was isolated as pale yellow oil. Following the general procedure 4, 20 mg of 42ag afforded 18 mg of 43ag (89% yield). $R_f = 0.3$ (Hexane/EtOAc мe = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3397, 2924, 1688, 1623, 1606, 1369, 43ag (*E/Z* = 6:1) 1155, 1008, 748. ¹H-NMR (400 MHz, CDCl₃): δ 7.85 (d, J = 7.7 Hz, 1H), 7.65-7.60 (m, 2H), 7.53-7.50 (m, 3H), 7.46-7.41 (m, 3H), 5.71 (s, 1H), 2.76 (d, J = 0.8 Hz, 3H), 1.89 (br s, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.2, 153.9, 149.6, 142.3, 138.8, 136.2, 134.7, 129.5, 129.0(2C), 128.5, 126.7(2C), 125.9, 123.5, 69.4, 21.2. **HRMS (ESI):** m/z calcd for C₁₇H₁₃O (M-OH)⁺: 233.0966. Found: 233.0949.

2-(2-Cyclohexylideneacetyl)benzaldehyde (42ah).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2918, 2851, 1694, 1648, 1441, 1363, 733. ¹H-NMR (400 **MHz, CDCl₃**): δ 10.26 (s, 1H), 7.94-7.93 (m, 1H), 7.72-7.69 (m, 1H), 7.66-7.58 (m, 2H), 6.47

(s, 1H), 2.81 (t, J = 5.6 Hz, 2H), 2.33-2.30 (m, 2H), 1.76-1.66 (m, 6H). ¹³C-NMR (100 MHz, CDCl₃): 8 193.8, 191.8, 165.8, 143.6, 135.9, 132.9, 131.0, 128.6, 128.3, 120.5, 38.5, 30.6, 28.8, 28.1, 28.0. **HRMS (ESI):** m/z calcd for $C_{15}H_{17}O_2$ (M+H)⁺: 229.1228. Found: 229.1243.

2-Cvclohexvlidene-3-hvdroxv-2,3-dihvdro-1H-inden-1-one (43ah).

This compound was isolated as colorless solid. Following the general procedure 4, 20 mg of 42ah afforded 18.8 mg of 43ah (91% yield). M.P = 116-117 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1}

3389, 2919, 2851, 1682, 1616, 1465, 1247, 1005, 747, ¹H-NMR (400 MHz, CDCl₃): δ 7.78 (d, J = 7.7 Hz, 1H), 7.72-7.70 (m, 1H), 7.66 (dt, J = 7.6 and 1.2 Hz, 1H), 7.50-7.46 (m, 1H), 5.66 (d, J = 5.7 Hz, 1H), 3.23-3.12 (m, 2H), 2.70-2.54 (m, 2H), 1.98 (d, J = 8.2 Hz, 1H), 1.81-1.65 (m, 6H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.0, 163.8, 149.6, 139.0, 134.6, 131.3, 129.4, 125.7, 123.4, 69.7, 33.9, 29.5, 28.7, 28.5, 26.2. **HRMS (ESI):** m/z calcd for C₁₅H₁₅O (M-OH)⁺: 211.1122. Found: 211.1145.

2-(2-Cycloheptylideneacetyl)benzaldehyde (42ai).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2924, 2853, 1696, 1653, 1594, 1445, 1247, 954, 758. ¹H-

NMR (400 MHz, CDCl₃): δ 10.23 (s, 1H), 7.93-7.91 (m, 1H), 7.69-7.67 (m, 1H), 7.65-7.61 (m, 1H), 7.60-7.54 (m, 1H), 6.59 (s, 1H), 2.98 (t, J = 6.0 Hz, 2H), 2.50 (t, J = 6.1 Hz, 2H), 1.75-1.71 (m, 4H), 1.59-1.57 (m, 4H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.7, 191.8, 170.5, 144.0, 135.8, 132.9, 130.8, 128.5, 128.0, 122.3, 39.6, 33.6, 29.8, 29.3, 28.1, 26.4. HRMS (ESI): m/z calcd for $C_{16}H_{19}O_2$ (M+H)⁺: 243.1385. Found: 243.1375.

2-Cycloheptylidene-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (43ai).

This compound was isolated as colorless solid. Following the general procedure 4, 20 mg of 42ah afforded 18.8 mg of 43ah (90% yield). M.P =125-126 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3385, 2923, 2853, 1681, 1615, 1465, 1337, 1249, 1005, 749, ¹H-NMR (400 MHz, CDCl₃): δ 7.71-7.68 (m, 2H), 7.65-7.61 (m, 1H), 7.45 (t, J = 7.4 Hz, 1H), 5.59 (s, 1H), 3.28-3.21 (m, 1H), 3.02-2.96 (m, 1H), 2.82-2.78 (m, 2H), 2.32 (s, 1H), 1.81-1.50 (m, 8H). ¹³C-NMR (100 MHz, CDCl₃): 8 192.6, 166.5, 149.9, 138.9, 134.4, 13.3, 129.3, 125.7, 123.2, 69.9, 34.8, 32.1, 29.9,

29.1, 26.9, 26.8. **HRMS (ESI)**: m/z calcd for C₁₆H₁₇O (M-OH)⁺: 225.1279. Found: 225.1259.

(E)-2-(2-(Chroman-4-ylidene)acetyl)benzaldehyde (42aj).

This compound was prepared by following the general procedure **3** and isolated as pale yellow solid. M.P = 77-79 °C. $R_f = 0.4$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3066, 2875, 1695, 1647, 1576, 1482,

1259, 1016, 756. ¹H-NMR (400 MHz, CDCl₃): δ 10.26 (s, 1H), 7.98 (dd, J = 7.5 and 1.4 Hz, 1H), 7.79-7.75 (m, 1H), 7.71-7.69 (m, 1H), 7.68-7.64 (m, 2H), 7.35 (ddd, J = 8.3, 7.2 and 1.5 Hz, 1H), 7.23 (t, J = 1.6 Hz, 1H), 6.98-6.93 (m, 2H), 4.31 (t, J = 6.1 Hz, 2H), 3.51-347 (m, 2H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.8, 191.7, 157.8, 149.5, 143.7, 135.8, 133.1, 132.8, 131.1, 129.1, 128.0, 124.6, 121.1, 120.6, 118.4, 115.5, 65.6, 27.6. HRMS (ESI): m/z calcd for C₁₈H₁₅O₃ (M+H)⁺: 279.1021. Found: 279.1044.

(E)-2-(Chroman-4-ylidene)-3-hydroxy-2,3-dihydro-1H-inden-1-one (43aj).

This compound was isolated as yellow solid. Following the general procedure **4**, 20 mg of **42aj** afforded 18.8 mg of **43aj** (93% yield). M.P = 143-145 °C. **a**_{3aj} (*E*/*Z* = 12:1) R_f = 0.3 (Hexane/EtOAc = 5/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3392, 2923, 1677, 1603, 1581, 1482, 1221, 1046, 749. ¹H-NMR (**400 MHz, CDCl**₃): δ 8.25 (dd, *J* = 8.1 and 1.4 Hz, 1H), 7.75 (t, *J* = 7.0 Hz, 2H), 7.69-7.65 (m, 1H), 7.49-7.46 (m, 1H), 7.36 (ddd, *J* = 8.3, 7.1 and 1.5 Hz, 1H), 7.09-7.04 (m, 1H), 6.91 (dd, *J* = 8.3 and 1.1 Hz, 1H), 5.96 (s, 1H), 4.31-4.21 (m, 2H), 3.61 (t, *J* = 6.1 Hz, 2H), 2.86 (br s, 1H). ¹³C-NMR (**100 MHz, CDCl**₃): δ 194.1, 157.6, 150.2, 145.6, 138.1, 134.9, 132.4, 131.6, 129.6, 129.6, 129.5, 125.6, 123.4, 120.9, 120.8, 117.8, 70.0, 66.1, 25.8. **HRMS (ESI):** *m*/*z* calcd for C₁₈H₁₃O₂ (M-OH)⁺: 261.0915. Found: 261.0903.

4-Methyl-2-(3-methylbut-2-enoyl)benzaldehyde (42ak).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2965, 2918, 1696, 1655, 1621, 1421, 758. ¹H-NMR (400

MHz, CDCl₃): δ 10.17 (d, J = 0.4 Hz, 1H), 7.85 (d, J = 7.8 Hz, 1H), 7.43 (d, J = 0.4 Hz, 1H), 7.39 (dd, J = 7.9 and 0.7 Hz, 1H), 6.54-6.53 (m, 1H), 2.47 (s, 3H), 2.25 (d, J = 1.1 Hz, 3H), 2.04 (d, J = 1.1 Hz, 3H). ¹³**C-NMR** (100 MHz, CDCl₃): δ 193.5, 191.4, 159.0, 144.2, 144.0, 133.0,

131.4, 129.0, 128.6, 123.4, 28.1, 21.7, 21.3. HRMS (ESI): m/z calcd for $C_{13}H_{15}O_2$ (M+H)⁺: 203.1072. Found: 203.1052.

3-Hydroxy-6-methyl-2-(propan-2-ylidene)-2,3-dihydro-1*H*-inden-1-one (43ak).

This compound was isolated as colorless solid. Following the general procedure **4**, 20 mg of **42ak** afforded 19 mg of **43ak** (95% yield). M.P = 162-163 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3449, 2922, 1680, 1621, 1366, 1287, 1110, 1022, 784. ¹H-NMR (400 MHz, CDCl₃): δ 7.60 (d, *J* = 7.8 Hz, 1H), 7.52 (s, 1H), 7.47 (d, *J* = 7.8 Hz, 1H), 5.57 (d, *J* = 7.5 Hz, 1H), 2.44 (s, 3H), 2.40 (s, 3H), 2.20 (s, 3H), 2.11 (d, *J* = 8.4 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.7, 155.4, 147.3, 139.6, 139.0, 135.7, 134.5, 125.5, 123.3, 69.8, 24.2, 21.4, 21.0. HRMS (ESI): *m/z* calcd for C₁₃H₁₃O (M-OH)⁺: 185.0966. Found: 185.0957.

5-Methoxy-2-(3-methylbut-2-enoyl)benzaldehyde (42al).

This compound was prepared by following the general procedure **3** and isolated as colorless oil. $R_f = 0.5$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 2940, 2913, 2872, 1695, 1651, 1602, 1567, 1426, 1236,

1010, 820. ¹H-NMR (400 MHz, CDCl₃): δ 10.27 (s, 1H), 7.72 (d, J = 8.5 Hz, 1H), 7.39 (d, J = 2.5 Hz, 1H), 7.10 (dd, J = 8.5 and 2.7 Hz, 1H), 6.63 (s, 1H), 3.90 (s, 3H), 2.22 (s, 3H), 2.03 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.0, 191.5, 161.8, 158.4, 139.1, 135.6, 130.8, 122.6, 118.6, 112.1, 28.1, 21.2. HRMS (ESI): m/z calcd for C₁₃H₁₅O₃ (M+H)⁺: 219.1021. Found: 219.1013.

3-Hydroxy-5-methoxy-2-(propan-2-ylidene)-2,3-dihydro-1*H*-inden-1-one (43al).

This compound was isolated as colorless solid. Following the general procedure **4**, 20 mg of **42al** afforded 18.4 mg of **43al** (92% yield). M.P = 167-168 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1}

¹3333, 2920, 2857, 1673, 1622, 1599, 1264, 1090, 797. ¹H-NMR (400 MHz, CDCl₃): δ 7.63 (d, J = 8.5 Hz, 1H), 7.14 (d, J = 2.2 Hz, 1H), 6.96 (dd, J = 8.5 and 2.1 Hz, 1H), 5.51 (d, J = 7.0 Hz, 1H), 3.92 (s, 3H), 2.35 (s, 3H), 2.32 (d, J = 7.0 Hz, 1H), 2.18 (s, 3H). ¹³C-NMR (100 MHz,

CDCl₃): § 191.4, 165.1, 154.2, 152.8, 134.3, 132.2, 125.1, 117.3, 108.6, 69.9, 55.7, 24.1, 20.7. **HRMS (ESI):** m/z calcd for C₁₃H₁₃O₂ (M-OH)⁺: 201.0915. Found: 201.0889.

(E)-2-(3,7-Dimethylocta-2,6-dienoyl)-5-methoxybenzaldehyde (42am).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2967, 2921, 2857, 1694, 1651,

This compound was isolated as colorless oil. Following the general

procedure 4, 20 mg of 42am afforded 18.8 mg of 43am (88% yield).

1600, 1567, 1284, 1112. ¹H-NMR (400 MHz, CDCl₃): δ 10.28 (s, 1H), 7.77-7.70 (m, 1H), 7.40 $(d, J = 2.6 \text{ Hz}, 1\text{H}), 7.11-7.08 \text{ (m, 1H)}, 6.60 \text{ (s, 1H)}, 5.15-5.13 \text{ (m, 1H)}, 3.91 \text{ (s, 3H)}, 2.67 \text{ (t, } J = 3.91 \text{ (s, 2H)}, 3.91 \text{$ 7.7 Hz, 1H), 2.29-2.24 (m, 3H), 2.21 (d, J = 1.2 Hz, 3H), 1.76 (s, 3H), 1.63 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.0, 191.7, 161.8, 161.4, 139.1, 135.8, 132.7, 130.8, 122.9, 122.2, 118.6, 112.0, 55.7, 41.4, 26.1, 25.7, 19.9, 17.7. **HRMS (ESI)**: *m/z* calcd for C₁₈H₂₃O₃ (M+H)⁺: 287.1647. Found: 287.1651.

(*E*)-2-(3,7-Dimethylocta-2,6-dienoyl)-5-methoxybenzaldehyde (43am).

 $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3382, 2967, 2919, 2854, 1681, 1627, 1599, 1490, 1256, 1094, ¹H-NMR (400 MHz, CDCl₃): δ 7.67-7.63 (m, 1H), 7.13-7.12 (m, 1H), 6.98-6.94 (m, 1H), 5.53-5.50 (m, 1H), 5.22-5.19 (m, 1H), 3.91 (s, 3H), 2.98-2.80 (m, 1H), 2.57-2.50 (m, 1H), 2.38-2.37 (m, 1H), 2.32-2.28 (m, 1H), 2.17 (s, 3H), 1.69 (s, 3H), 1.64 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.7, 165.05, 158.2, 152.7, 134.4, 132.3, 132.2, 125.2, 123.7, 117.3, 108.6, 70.0, 55.7, 33.9, 27.1, 25.7, 22.2, 17.6. HRMS (ESI): m/z calcd for C₁₈H₂₁O₂ (M-OH)⁺: 269.1541. Found: 269.1529.

1-(2-Acetylphenyl)-3-methylbut-2-en-1-one (42an).

This compound was prepared by following the general procedure 3 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm⁻¹ 3057, 2968, 2876, 1679, 1651, 1620, 1413, 1021, 763. ¹H-**NMR (400 MHz, CDCl₃):** δ 7.75 (dd, J = 7.6 and 1.2 Hz, 1H), 7.53-7.51 (m, 2H), 7.18 (dd, J =

7.2 and 1.2 Hz, 1H), 6.48-6.47 (m, 1H), 2.55 (s, 3H), 2.21 (d, J = 1.0 Hz, 3H), 2.00 (d, J = 1.0

Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 201.7, 193.9, 157.5, 138.6, 131.0, 130.7, 130.4, 1128.6, 127.7, 127.6, 28.0, 21.1, 20.4. HRMS (ESI): m/z calcd for C₁₃H₁₅O₂ (M+H)⁺: 203.1072. Found: 203.1079.

3-Hydroxy-3-methyl-2-(propan-2-ylidene)-2,3-dihydro-1*H*-inden-1-one (43an).

Me OH Me Me

This compound was isolated as pale brown solid. Following the general procedure **4**, 20 mg of **42an** afforded 18.4 mg of **43an** (92% yield). M.P = 133-

43an 135 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3420, 2972, 2929, 1683, 1620, 1292, 1092, 756. ¹H-NMR (400 MHz, CDCl₃): δ 7.77 (dt, J = 7.6 and 1.0 Hz, 1H), 7.72-7.70 (m, 1H), 7.69-7.65 (m, 1H), 7.49-7.45 (m, 1H), 2.46 (s, 3H), 2.29 (s, 3H), 2.01 (br s, 1H), 1.76 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.4, 155.4, 153.9, 137.6, 136.9, 134.7, 129.1, 123.3, 123.1, 76.0, 27.5, 23.3, 22.0. HRMS (ESI): m/z calcd for C₁₃H₁₃O (M-OH)⁺: 185.0966. Found: 185.0970.

1-(2-Benzoylphenyl)-3-methylbut-2-en-1-one (42ao).

This compound was prepared by following the general procedure **3** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 9/1). IR (thin film, neat): v_{max}/cm^{-1} 3040, 2965, 2887, 1673, 1653, 1614, 1402, 1024, 767. ¹H-NMR (400 MHz, CDCl₃): δ 7.87-7.77 (m, 3H), 7.59-7.53(m, 3H), 7.47-7.41 (m, 3H), 6.54-6.52 (m, 1H), 1.96 (d, J = 1.0 Hz, 3H), 1.92 (d, J = 1.1 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.7, 192.0, 158.1, 140.7, 140.4, 137.5, 132.8, 131.0, 129.7, 129.5(2C), 128.5, 128.32, 128.3(2C), 122.5, 27.8, 21.0. HRMS (ESI): m/z calcd for $C_{18}H_{16}NaO_2$ (M+Na)⁺: 287.1048. Found: 287.1057.

3-Hydroxy-3-phenyl-2-(propan-2-ylidene)-2,3-dihydro-1*H*-inden-1-one (43ao).

This compound was isolated as pale brown solid. Following the general procedure **4**, 25 mg of **42ao** afforded 24 mg of **43ao** (96% yield). M.P = 202-203 °C. $R_f = 0.4$ (Hexane/EtOAc = 5/1). **IR (thin film, neat):** v_{max} /cm⁻¹ 3335,

2922, 1681, 1616, 1448, 1240, 1029, 768. ¹H-NMR (**400** MHz, CDCl₃): δ 7.77 (dt, *J* = 7.6 and 0.9 Hz, 1H), 7.56-7.52 (m, 1H), 7.47-7.54 (m, 2H), 7.43-7.40 (m, 1H), 7.37-7.36 (m, 1H), 7.35-7.31 (m, 2H), 7.28-7.21 (m, 1H), 2.68 (s, 1H), 2.43 (s, 3H), 1.81 (s, 3H). ¹³C-NMR (**100** MHz,

CDCl₃): § 193.3, 156.2, 155.1, 144.3, 138.9, 136.9, 135.1, 129.0, 128.3(2C), 126.7, 125.1(2C), 124.8, 123.2, 79.2, 24.0, 21.9. **HRMS (ESI):** m/z calcd for C₁₈H₁₅O (M-OH)⁺: 247.1122. Found: 247.1118.

1-(3-Acetylbenzo[b]thiophen-2-yl)-3-methylbut-2-en-1-one (42ap).

This compound was prepared by following the general procedure 2 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm⁻¹ 2965, 2887, 1671, 1650, 1619, 1428, 1208, 758. ¹H-NMR (**400 MHz, CDCl₃**): δ 7.89-7.87 (m, 1H), 7.79-7.76 (m, 1H), 7.54-7.44 (m,

2H), 6.63-6.62 (m, 1H), 2.63 (s, 3H), 2.31 (d, J = 1.1 Hz, 3H), 2.07 (d, J = 1.1 Hz, 3H). ¹³C-**NMR (100 MHz, CDCl₃):** δ 201.7, 183.7, 161.1, 142.3, 140.6, 139.4, 136.7, 127.6, 125.7, 124.3, 122.8, 121.7, 31.5, 28.3, 21.6. **HRMS (ESI):** *m/z* calcd for C₁₅H₁₅O₂S (M+H)⁺: 259.0792. Found: 259.0788.

1-Hydroxy-1-methyl-2-(propan-2-ylidene)-1*H*-benzo[*b*]cyclopenta[*d*]thiophen-3(2*H*)-one (43ap).

This compound was isolated as colorless solid. Following the general procedure 4, 20 mg of 42ap afforded 18.6 mg of 43ap (93% yield). M.P = 173-174 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1}

3379, 2925, 1681, 1631, 1367, 1241, 1089, 763. ¹H-NMR (400 MHz, CDCl₃): δ 8.16-8.13 (m, 1H), 7.94-7.92 (m, 1H), 7.52-7.49 (m, 2H), 2.42 (s, 3H), 2.28 (s, 3H), 2.24 (s, 1H), 1.93 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.8, 161.3, 151.0, 147.6, 143.4, 140.5, 132.3, 127.8, 125.2, 124.9, 124.5, 75.5, 25.6, 23.0, 21.5. **HRMS (ESI):** m/z calcd for C₁₅H₁₅O₂S (M+H)⁺: 259.0792. Found: 259.0798.

1-(3-Acetylpyridin-2-yl)-3-methylbut-2-en-1-one (42aq).

This compound was prepared by following the general procedure 3 and isolated as colorless oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2969, 1738, 1698, 1615, 1435, 1365, 1216, 748, ¹H-NMR (400 MHz, CDCl₃): δ 8.72 (dd, J = 4.6 and 1.6 Hz, 1H), 7.72 (dd, J = 7.7 and 1.7 Hz, 1H), 7.49 (dd, J = 7.7 and 4.8

Hz, 1H), 7.31-7.28 (m, 1H), 2.54 (s, 3H), 2.31 (d, J = 0.9 Hz, 3H), 2.10 (d, J = 1.0 H, 3H). ¹³C-

NMR (100 MHz, CDCl₃): δ 202.6, 190.1, 161.3, 153.2, 149.3, 138.6, 134.6, 125.6, 120.0, 30.5, 28.5, 21.6. **HRMS (ESI):** m/z calcd for C₁₂H₁₄NO₂ (M+H)⁺: 204.1024. Found: 204.1017.

5-Hydroxy-5-methyl-6-(propan-2-ylidene)-5*H*-cyclopenta[*b*]pyridin-7(6*H*)-one (43aq).

This compound was isolated as colorless solid. Following the general procedure **4**, 20 mg of **42aq** afforded 18 mg of **43aq** (90% yield). M.P = 195-197 °C. $R_f =$ 0.2 (Hexane/EtOAc = 1/2). IR (thin film, neat): v_{max}/cm^{-1} 3367, 2924, 2851, 1713, 1621, 1311, 764. ¹H-NMR (400 MHz, CDCl₃): δ 8.72-8.67 (m, 1H), 8.09 (d, J = 7.9 Hz, 1H), 7.50-7.46 (m, 1H), 2.75 (brs, 1H), 2.44-2.42 (m, 3H), 2.31 (s, 3H), 1.75 (d, *J* = 3.0 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.9, 156.7, 153.1, 151.9, 149.9, 136.5, 132.5, 127.9, 74.1, 27.2, 23.6, 22.4. **HRMS (ESI):** m/z calcd for C₁₂H₁₄NO₂ (M+H)⁺: 204.1024. Found: 204.1017.

General Procedure 6: Synthesis of dienones 58

Step-I: The alcohols 50 were synthesized from 2-bromo aldehydes 49 by following the general procedure **3**, Step I.

Step-II: An oven dried 25 mL long neck RB flask was charged with 2-bromo alcohol 50 (1.0 mmol), 5 mL dry THF and placed at -78 °C. n-BuLi (1.6 M in hexanes, 2.2 mmol) was added dropwise at the same temperature and stirred for 2 hours. An appropriate dienal 63 (1.3 mmol) dissolved in 1 mL of dry THF, was added dropwise over 2 mins and stirred at room temperature for 30 mins. The reaction mixture was quenched with saturated aq. ammonium chloride solution and extracted using ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate, and concentrated. The crude product was purified by silica gel column chromatography using hexanes/ethyl acetate as eluent to afford the diol 64.

Step-III: Alcohols 64 were oxidized using IBX following the general procedure 3, Step III to afford dienones 58.

General procedure 7: Synthesis of dienones 58j and 58v

The Substrates bearing chromene backbone 58j and 58v also can be readily synthesized from 4bromo-2H-chromene-3-carbaldehyde **65** by following the general procedure **6**.

General Procedure 8: Synthesis of dienones 58k and 58l

Step-I: To a solution of *N*-methylpiperazine (NMP, 0.18 mL, 1.6 mmol) in THF (5 mL) at -78 °C was added *n*-BuLi (1.6 *M* in hexane, 1.0 mL, 1.6 mmol). After 15 min, thiophene- or benzothiophene-3-carboxaldehyde **44** (200 mg, 1.2 mmol) was added and then the reaction mixture was stirred for an additional 30 min. A hexane solution of *n*-BuLi (2.0 mL, 3.2 mmol) was added and the mixture was stirred for an additional 15 min and then the mixture was warmed to -30 °C in 2 h. The solution was again cooled to -78 °C and 2,4-hexa-dienal **63a** (1.5 mmol) was added dropwise over 5 min. The mixture was warmed to room temperature over 30 min. The reaction progress was monitored by TLC. Reaction mixture was quenched with saturated aqueous ammonium chloride solution and extracted with ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford dienol **68**.

Step-II: Alcohol **68** (1 mmol) was dissolved in ethyl acetate (10 mL), and IBX (1.5 mmol) was added. The resulting suspension was immersed in an oil bath set to 75 °C and stirred until alcohol **68** disappeared as monitored by TLC. The reaction was cooled to room temperature and filtered through Buchner funnel. The filter cake was washed with 3×2 mL of ethyl acetate. Organic extracts were combined and worked up using saturated sodium bicarbonate solution to remove excess iodobenzoic acid. The extract was dried over anhydrous sodium sulphate and concentrated under vacuum. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford the dienone **58k** and **58l**.

General Procedure 9: Synthesis of dienone 580

In to solution of Alcohol **68** in dry THF, methylmagnesium bromide (1.2 eq.) was added at 0 °C. The reaction was continued until the starting alcohol **68** disappeared as monitored by TLC. The reaction mixture was quenched by saturated aqueous ammonium chloride and extracted using ethyl acetate. Organic extracts were combined, dried over anhydrous sodium sulphate and concentrated to afford the diol **69** and proceeded to the next step without purification. Subsequent IBX oxidation of diol **69** delivered the desired enone-ketone **580**.

General procedure 10: Intramolecular MBH reaction of dienones

An oven dried 5 mL glass vial was charged with **58** (30 mg, 0.15 mmol). Toluene (1 mL) and PMe_3 (1 M solution in toluene, 0.1 mL, 0.015 mmol) were introduced at room temperature (rt) under nitrogen atmosphere and stirring continued at rt until **58** disappeared as monitored by TLC. All the volatiles were removed under reduced pressure. The crude product was purified by silica gel flash chromatography using hexane/ethyl acetate as eluent, to afford **58**.

General Procedure 11: Enantioselective intramolecular MBH of dienones

An oven dried 5 mL glass vial was charged with **58** (20 mg, 0.1 mmol) in 1,1,1,3,3,3-hexafluoroisopropanol (HFIP, 0.5 mL), catalyst **C23** was introduced at room temperature (rt) under nitrogen atmosphere and stirring continued at rt until **58** disappeared as monitored by TLC. Volatiles were removed under reduced pressure. The crude product was purified by silica gel flash chromatography using hexane/ethyl acetate as eluent, to afford **58**.

2-((2E,4E)-Hexa-2,4-dienoyl)benzaldehyde (58a).

This compound was prepared by following the general procedure **6** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3447, 2910, 1701, 1663, 1586, 1199, 1002, 770. ¹H-NMR

(400 MHz, CDCl₃): δ 10.12 (s, 1H), 7.97-7.95 (m, 1H), 7.68-7.56 (m, 3H), 7.06 (dd, J = 15.3 and 10.8 Hz, 1H), 6.56 (d, J = 15.3 Hz, 1H), 6.31-6.18 (m, 2H), 1.88 (d, J = 6.4 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.6, 191.2, 147.6, 142.6, 142.0, 135.4, 133.2, 130.7, 130.2, 129.2, 128.3, 127.3, 19.0. HRMS (ESI): m/z calcd for C₁₃H₁₃O₂ (M+H): 201.0916. Found: 201.0905.

(S)-2-((E)-But-2-en-1-ylidene)-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (61a).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 25 mg of **58a** afforded 24 mg of **61a** (97% yield). M.P = 117-119 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3382, 2910, 1687, 1632, 1030, 922, 754. ¹H-NMR (**400** MHz, CDCl₃): δ 7.76 (t, J = 7.6 Hz, 2H), 7.69 (dt, J = 7.6 and 1.2 Hz, 1H), 7.50-7.46 (m, 1H), 7.28-7.26 (m, 1H), 6.86-6.79 (m, 1H), 6.41 (sextet, 3.2 Hz, 1H), 5.73 (d, J = 9.6 Hz, 1H), 2.25 (d, J = 9.5 Hz, 1H), 2.00 (dd, J = 7.0 and

0.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.1, 151.0, 143.8, 138.0, 137.3, 136.3, 135.1, 129.6, 127.7, 125.9, 123.4, 69.0, 19.3. HRMS (ESI): *m*/*z* calcd for *m*/*z* calcd for C₁₃H₁₁O (M-OH): 183.0810. Found: 183.0821.

Optical rotation: $[\alpha]_{D}^{23} + 31.7$ (*c* 0.20, CHCl₃) for a sample with *ee* 97%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (92:8 *n*-Hexane/2-Propanol, 0.8 mL/min, 254 nm, $\tau_{major} = 34.4$ min, $\tau_{minor} = 39.7$ min).

2-((2E,4E)-5-Phenylpenta-2,4-dienoyl)benzaldehyde (58b).

This compound was prepared by following the general procedure **6** and isolated as a pale yellow solid. M.P = 67-69 °C. $R_f = 0.5$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3029, 2859, 1695, 1649, 1614, 1581,

1253, 1022, 775. ¹H-NMR (**400** MHz, CDCl₃): δ 10.18 (s, 1H), 8.02 (d, *J* = 7.2 Hz, 1H), 7.71-7.64 (m, 3H), 7.50 (d, *J* = 7.2 Hz, 2H), 7.41-7.35 (m, 3H), 7.31-7.25 (m, 1H), 7.01-6.99 (m, 2H), 6.80 (d, *J* = 7.3 Hz, 1H). ¹³C-NMR (**100** MHz, CDCl₃): δ 194.3, 191.2, 147.1, 143.0, 141.9, 135.7, 135.5, 133.2, 130.9, 129.6, 129.3, 129.1, 128.9(2C), 128.3, 127.4(2C), 126.4. HRMS (ESI): *m*/*z* calcd for C₁₈H₁₅O₂ (M+H): 263.1072 Found: 263.1081.

(E)-3-Hydroxy-2-((E)-3-phenylallylidene)-2,3-dihydro-1*H*-inden-1-one (61b).

This compound was isolated as pale yellow solid. Following the general procedure **10**, 50 mg of **58b** afforded 46 mg of **61b** (91% yield). M.P = 162- **61b** (*E*/*Z* = 3:1)
This compound was isolated as pale yellow solid. Following the general procedure **10**, 50 mg of **58b** afforded 46 mg of **61b** (91% yield). M.P = 162- **164** °C. R_f = 0.3 (Hexane/EtOAc = 4/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3395, 3064, 1691, 1614, 1293, 976, 765. ¹H-NMR (**400** MHz, CDCl₃): δ 7.80-7.78 (m, 1H), 7.70-7.51 (m, 5H), 7.43-7.34 (m, 5H), 7.02 (dd, *J* = 15.2 and 3.2 Hz, 1H), 5.97 (d, *J* = 4.8 Hz, 1H), 2.86 (d, *J* = 4.9 Hz, 1H). ¹³C-NMR (**100** MHz, CDCl₃): δ 192.2, 151.2, 144.1, 138.3, 137.9, 137.3, 136.0, 135.2, 129.6, 129.5, 128.9(2C), 127.7(2C), 125.9, 124.0, 123.4, 69.1. HRMS (**ESI**): *m*/*z* calcd for C₁₈H₁₃O (M-OH): 245.0966. Found: 245.0970.

2-((2E,4E)-5-(Naphthalen-2-yl)penta-2,4-dienoyl)benzaldehyde (58c).

This compound was prepared by following the general procedure **6** and isolated as pale yellow solid. M.P = 107-109 °C. R_f = 0.4

(Hexane/EtOAc = 3/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3056, 1695, 1650, 1579, 1326, 1274, 1022, 748. ¹H-NMR (400 MHz, CDCl₃): δ 10.20 (s, 1H), 8.02 (d, J = 7.5 Hz, 1H), 7.85-7.83 (m, 4H), 7.72-7.65 (m, 4H), 7.53-7.50 (m, 2H), 7.36-7.33 (m, 1H), 7.13-7.12 (m, 2H), 6.83 (d, J = 15.2 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.2, 191.3, 147.1, 143.1, 141.9, 135.6, 133.8, 133.4, 133.3, 133.2, 130.9, 129.4, 129.0, 128.8, 128.7, 128.43, 128.4, 127.8, 127.0, 126.8, 126.7, 123.3. HRMS (ESI): m/z calcd for C₂₂H₁₆NaO₂ (M+Na): 335.1048. Found: 335.1051.

(S)-3-Hydroxy-2-((E)-3-(naphthalen-2-yl)allylidene)-2,3-dihydro-1*H*-inden-1-one (61c).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 20 mg of **58c** afforded 19.4 mg of **61c** (97% yield). M.P = 169-171 °C. $R_f = 0.2$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3660, 2937, 1697, 1604, 1072, 1022, 746. ¹H-

NMR (400 MHz, (CD₃)₂SO): δ 8.08 (s, 1H), 7.99-7.87 (m, 4H), 7.81-7.68 (m, 4H), 7.59-7.54 (m, 3H), 7.54-7.37 (m, 2H), 6.18 (d, *J* = 8.4 Hz, 1H), 5.85 (d, *J* = 8.4 Hz, 1H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 192.0, 152.9, 142.8, 140.6, 138.0, 135.6, 135.3, 134.3, 133.7, 133.5, 129.7, 129.0, 128.8, 128.7, 128.1, 127.4, 127.2, 126.9, 125.7, 124.1, 123.0, 67.7. HRMS (ESI): *m/z* calcd for C₂₂H₁₅O (M-OH): 295.1123. Found: 295.1129.

Optical rotation: $[\alpha]^{23}{}_{\rm D}$ +78.9 (*c* 0.08, DMSO) for a sample with *ee* 92%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (88:12 *n*-Hexane/2-Propanol, 0.8 mL/min, 254 nm, $\tau_{\rm major} = 22.1$ min, $\tau_{\rm minor} = 30.2$ min).

2-((2E,4E)-5-(3,4-Dimethoxyphenyl)penta-2,4-dienoyl)benzaldehyde (58d).

This compound was prepared by following the general procedure **6** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 2956, 2925, 1712, 1654, 1463, 1378,

1267, 1023, 745. ¹**H-NMR (400 MHz, CDCl₃):** δ 10.17 (s, 1H), 8.00 (d, J = 7.6 Hz, 1H), 7.68-7.62 (m, 3H), 7.30-7.23 (m, 1H), 7.05-7.02 (m, 2H), 6.90-6.85 (m, 3H), 6.75 (d, J = 14.9 Hz, 1H), 3.93 (s, 3H), 3.91 (s, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 194.2, 191.2, 150.6, 149.2, 147.6, 143.2, 142.1, 135.4, 133.2, 130.8, 129.2, 128.8, 128.3, 128.0, 124.5, 121.8, 111.1, 109.1, 56.0, 55.9. **HRMS (ESI):** m/z calcd for C₂₀H₁₉O₄ (M+H): 323.1283. Found: 323.1290.

(S)-2-((E)-3-(3,4-dimethoxyphenyl)allylidene)-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (61d).

This compound was isolated as pale brown solid. Following the general procedure **11**, 20 mg of **58d** afforded 17.5 mg of **61d** (87% yield). M.P = 144-146 °C. $R_f = 0.2$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3456, 2932, 1694, 1608, 1517, 1269, 1023, 759. ¹H-NMR (400 MHz, (CD₃)₂SO): δ 7.77-7.76 (m, 2H), 7.72 (d,

J = 7.6 Hz, 1H), 7.57-7.53 (m, 1H), 7.43 (dd, J = 15.4 and 12.1 Hz, 1H), 7.31-7.16 (m, 4H), 7.02 (d, J = 8.4 Hz, 1H), 6.11 (d, J = 8.0 Hz, 1H), 5.80 (d, J = 8.0 Hz, 1H), 3.85 (s, 3H), 3.81 (s, 3H). ¹³**C-NMR (100 MHz, (CD₃)₂SO):** δ 191.9, 152.8, 150.7, 149.4, 143.4, 139.2, 138.1, 135.8, 135.4, 129.6, 129.5, 126.8, 123.0, 122.9, 122.2, 112.2, 110.1, 67.7, 56.0, 55.9. **HRMS (ESI):** m/z calcd for C₂₀H₁₇O₃ (M-OH): 305.1178. Found: 305.1180.

Optical rotation: $[\alpha]^{23}_{D}$ +135.8 (*c* 0.18, CHCl₃) for a sample with *ee* 78%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AD Column (85:15 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 20.3 \text{ min}, \tau_{minor} = 29.1 \text{ min}$).

5-Fluoro-2-((2E,4E)-hexa-2,4-dienoyl)benzaldehyde (58e).

This compound was prepared by following the general procedure **6** and isolated as a pale yellow solid. M.P = 100-102 °C. $R_f = 0.4$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 2956, 1691,

HRMS (ESI): m/z calcd for C₁₃H₁₂FO₂ (M+H): 219.0821. Found: 219.0821.

(S)-2-((E)-But-2-en-1-ylidene)-5-fluoro-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (61e).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 20 mg of **58e** afforded 18.5 mg of **61e** (93% yield). M.P = 159-161 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 3442, 2927, 1703, 1634, 1266, 1015, 750. ¹H-NMR (400 MHz,

CDCl₃): δ 7.75-7.72 (m, 1H), 7.42 (dd, J = 8.1 and 1.9 Hz, 1H), 7.24 (dd, J = 11.2 and 2.4 Hz, 1H), 7.18-7.13 (m, 1H), 6.84-6.77 (m, 1H), 6.40 (sextet, J = 3.2 Hz, 1H), 5.60 (s, 1H), 2.42 (br s, 1H), 2.01 (dd, J = 6.8 and 1.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.6, 163.3 (d, J = 253.1 Hz), 144.3, 137.5, 135.9, 134.2, 127.5, 125.8 (d, J = 10.3 Hz), 117.6 (d, J = 32.0 Hz), 117.5, 112.8 (d, J = 25.3 Hz), 68.7, 19.4. ¹⁹F-NMR (376 MHz, CDCl₃): δ -101.1. HRMS (ESI): m/z calcd for C₁₃H₁₀FO (M-OH): 201.0716. Found: 201.0722.

Optical rotation: $[\alpha]^{23}_{D}$ +69.1 (*c* 0.12, CHCl₃) for a sample with *ee* 99%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak IC Column (95:5 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 39.5$ min, $\tau_{minor} = 27.7$ min).

2-((2E,4E)-Hexa-2,4-dienoyl)-5-methoxybenzaldehyde (58f).

This compound was prepared by following the general procedure **6** and isolated as pale yellow solid. M.P = 82-85 °C. $R_f = 0.4$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3440, 2938,

1693, 1653, 1596, 1260, 1015, 750. ¹H-NMR (400 MHz, CDCl₃): δ 10.20 (s, 1H), 7.67 (d, J = 8.5 Hz, 1H), 7.45 (d, J = 2.4 Hz, 1H), 7.25-7.12 (m, 2H), 6.65 (d, J = 15.2 Hz, 1H), 6.33-6.27 (m, 2H), 3.92 (s, 3H), 1.91 (d, J = 6.0 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.2, 191.6, 161.8, 146.7, 142.2, 138.6, 134.3, 130.8, 130.3, 126.1, 118.9, 112.3, 55.7, 18.9. HRMS (ESI): m/z calcd for C₁₄H₁₄NaO₃ (M+Na): 253.0841. Found: 253.0836.

(S)-2-((E)-But-2-en-1-ylidene)-3-hydroxy-5-methoxy-2,3-dihydro-1*H*-inden-1-one (61f).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 25 mg of **58f** afforded 23.5 mg of **61f** (94% yield). M.P = 129-131 °C. $R_f = 0.2$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat):

 v_{max}/cm^{-1} 3374, 2926, 1681, 1631, 1597, 1290, 1018, 759. ¹H-NMR (400 MHz, CDCl₃): δ 7.69-7.67 (m, 1H), 7.21-7.18 (m, 2H), 6.99-6.97 (m, 1H), 6.83-6.76 (m, 1H), 6.38-6.33 (m, 1H), 5.65 (s, 1H), 3.94 (s, 3H), 2.46 (br s, 1H), 1.98 (dd, J = 6.8 and 1.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.8, 165.5, 154.1, 143.0, 136.7, 136.2, 131.3, 127.6, 125.3, 117.5, 108.9, 68.9, 55.8, 19.3. HRMS (ESI): m/z calcd for C₁₄H₁₅O₃ (M+H): 231.1021. Found: 231.1009.

Optical rotation: $[\alpha]^{23}_{D}$ -2.7 (*c* 0.14, CHCl₃) for a sample with *ee* 94%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (90:10 n-Hexane/2-Propanol, 0.8 mL/min, 254 nm, $\tau_{major} = 18.2 \text{ min}, \tau_{minor} = 16.2 \text{ min}$).

5-Methoxy-2-((2E,4E)-5-phenylpenta-2,4-dienoyl)benzaldehyde (58g).

This compound was prepared by following the general procedure 6and isolated as pale brown oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm⁻¹ 3027, 1692, 1653, 1596, 1579, 1350, 1237,

1016, 736. ¹**H-NMR (400 MHz, CDCl₃):** δ 10.25 (s, 1H), 7.73 (d, J = 8.4 Hz, 1H), 7.51-7.34 (m, 7H), 7.16 (dd, J = 8.4 and 2.7 Hz, 1H), 7.02 (d, J = 4.8 Hz, 1H), 7.00 (s, 1H), 6.89 (d, J =15.2 Hz, 1H), 3.93 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.6, 162.0, 146.2, 142.7, 138.9, 138.8, 135.8, 134.2, 130.9, 129.5, 128.9(2C), 127.9, 127.4(2C), 126.5, 118.9, 112.5, 55.8. **HRMS (ESI):** m/z calcd for C₁₉H₁₇O₃ (M+H): 293.1178. Found: 293.1178.

(S)-3-Hydroxy-5-methoxy-2-((E)-3-phenylallylidene)-2,3-dihydro-1*H*-inden-1-one (61g).

procedure 11, 18 mg of 58g afforded 17 mg of 61g (95% yield). M.P =170-172 °C. $R_f = 0.2$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3308, 2928, 1667, 1601, 1275, 1260, 1020, 749. ¹H-NMR (400 MHz, (CD₃)₂SO): δ

This compound was isolated as pale yellow solid. Following the general

7.68 (d, J = 8.3 Hz, 1H), 7.64-7.62 (m, 2H), 7.55 (dd, J = 16.0 and 12.0 Hz, 1H), 7.45-7.42 (m, 2H), 7.38-7.35 (m, 1H), 7.24-7.18 (m, 3H), 7.09 (dd, J = 8.0 and 2.4 Hz, 1H), 6.12 (d, J = 8.4Hz, 1H), 5.73 (d, J = 8.2 Hz, 1H), 3.91 (s, 3H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 190.2, 165.5, 155.9, 141.9, 141.0, 136.7, 133.9, 131.3, 129.6, 129.4(2C), 127.8(2C), 125.2, 125.0, 117.4, 110.0, 67.7, 56.3. HRMS (ESI): *m/z* calcd for C₁₉H₁₅O₂ (M-OH): 275.1072. Found: 275.1085.

Optical rotation: $\left[\alpha\right]_{D}^{23}$ +125.2 (c 0.10, CHCl₃) for a sample with *ee* 96%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (80:10 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 28.7 \text{ min}$, $\tau_{\text{minor}} = 22.0 \text{ min}$).

2-((2E,4E)-Hexa-2,4-dienoyl)-4,5-dimethoxybenzaldehyde (58h).

This compound was prepared by following the general procedure **6** and isolated as a pale yellow solid. M.P = 127-129 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3006, 2851,

1672, 1588, 1519, 1355, 1283, 1118, 871, 736. ¹H-NMR (400 MHz, CDCl₃): δ 10.05 (s, 1H), 7.50 (s, 1H), 7.15-7.08 (m, 1H), 7.03 (s, 1H), 6.54 (d, *J* = 15.2 Hz, 1H), 6.32-6.25 (m, 2H), 3.98 (s, 6H), 1.89 (d, *J* = 6.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.5, 189.8, 152.7, 150.7, 147.4, 142.7, 137.1, 130.2, 129.2, 127.5, 110.5, 109.5, 56.3, 56.2, 19.0. HRMS (ESI): *m*/*z* calcd for C₁₅H₁₆NaO₄ (M+H): 283.0946. Found: 283.0965.

(S)-2-((E)-But-2-en-1-ylidene)-3-hydroxy-5,6-dimethoxy-2,3-dihydro-1*H*-inden-1-one (61h).

This compound was isolated as Pale yellow solid. Following the general procedure **11**, 25 mg of **58h** afforded 23 mg of **61h** (93% yield). M.P = 147-149 °C. $R_f = 0.2$ (Hexane/EtOAc = 3/1). IR (thin

film, neat): $v_{\text{max}}/\text{cm}^{-1}$ 3374, 2931, 1682, 1591, 1306, 1100, 760. ¹H-NMR (400 MHz, CDCl₃): δ 7.17 (s, 1H), 7.05 (d, J = 12.1 Hz, 1H), 7.02 (s, 1H), 6.84-6.77 (m, 1H), 6.34-6.29 (m, 1H), 5.60 (s, 1H), 4.02 (s, 3H), 3.89 (s, 3H), 2.55 (br s, 1H), 1.98 (dd, J = 6.8 and 0.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.3, 155.6, 150.8, 146.4, 142.7, 136.8, 135.6, 131.3, 127.7, 106.7, 103.8, 68.8, 56.4, 56.1, 19.2. HRMS (ESI): m/z calcd for C₁₅H₁₅O₃ (M-OH): 243.1021. Found: 243.1035.

Optical rotation: $[\alpha]_{D}^{23}$ -49.6 (*c* 0.15, CHCl₃) for a sample with *ee* 93%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AD Column (88:12 *n*-Hexane/2-Propanol, 0.7 mL/min, 254 nm, $\tau_{major} = 20.8 \text{ min}, \tau_{minor} = 25.6 \text{ min}$).

1-((2E,4E)-Hexa-2,4-dienoyl)-2-naphthaldehyde (58i).

This compound was prepared by following the general procedure **6** and isolated as pale brown solid. M.P = 85-87 °C. $R_f = 0.4$ (Hexane/EtOAc =

4/1). IR (thin film, neat): v_{max}/cm^{-1} 3016, 1697, 1275, 1260, 764, 750.

¹**H-NMR (400 MHz, CDCl₃):** δ 10.17 (s, 1H), 8.05-7.94 (m, 3H), 7.85 (d, J = 8.8 Hz, 1H), 7.69-7.65 (m, 1H), 7.60-7.56 (m, 1H), 6.79-6.72 (m, 1H), 6.60 (d, J = 15.6 Hz, 1H), 6.31-6.28 (m, 1H), 6.09-6.03 (m, 1H), 1.85 (d, J = 6.8 Hz, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 198.2, 190.4,

149.0, 143.3, 139.4, 136.1, 130.7, 130.4, 130.2, 129.9, 129.7, 129.3, 128.4, 127.8, 126.7, 123.0, 19.0. **HRMS (ESI):** *m*/*z* calcd for C₁₇H₁₄O₂ (M+H)⁺: 251.1072. Found: 251.1053.

(S)-2-((E)-But-2-en-1-ylidene)-3-hydroxy-2,3-dihydro-1*H*-cyclopenta[*a*]naphthalen-1-one (61i).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 20 mg of **58i** afforded 18.6 mg of **61i** (93% yield). M.P = 196-198 °C. $R_f = 0.2$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3365, 2926, 1693, 1608, 1517, 1441, 1176, 834, 760. ¹H-NMR

(400 MHz, (CD₃)₂SO): δ 9.13 (d, *J* =8.4 Hz, 1H), 8.31 (d, *J* = 8.4 Hz, 1H), 8.09 (d, *J* = 8.0 Hz, 1H), 7.83 (d, *J* = 8.4 Hz, 1H), 7.77-7.73 (m, 1H), 7.68-7.64 (m, 1H), 7.11 (d, *J* = 11.9 Hz, 1H), 6.86-6.79 (m, 1H), 6.45-6.40 (m, 1H), 5.99 (d, *J* = 8.4 Hz, 1H), 5.71 (d, *J* = 8.3 Hz, 1H), 1.94 (dd, *J* = 6.8 and 1.1 Hz, 3H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 193.0, 155.2, 141.9, 138.3, 136.5, 134.2, 133.5, 131.7, 129.5, 129.1, 128.6, 128.5, 127.6, 124.3, 123.7, 67.5, 19.5. HRMS (ESI): *m*/*z* calcd for C₁₇H₁₄O₂ (M+H)⁺: 251.1072. Found: 251.1089.

Optical rotation: $[\alpha]^{23}{}_{D}$ +44.9 (*c* 0.08, CHCl₃) for a sample with *ee* 99%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (90:10 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 19.6 \text{ min}, \tau_{minor} = 13.7 \text{ min}$).

4-((2*E*,4*E*)-Hexa-2,4-dienoyl)-2*H*-chromene-3-carbaldehyde (58j).

This compound was prepared by following the general procedure **7** and isolated as light brown oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3370, 3030, 2832, 2745, 1701, 1654, 1616, 1578,

1458, 1100, 752. ¹H-NMR (**400** MHz, CDCl₃): δ 9.65 (s, 1H), 7.36-7.32 (m, 1H), 7.16-7.09 (m, 2H), 6.97-6.94 (m, 2H), 6.37 (d, *J* = 15.2 Hz, 1H), 6.31-6.29 (m, 2H), 5.03 (s, 2H), 1.91 (d, *J* = 5.0 Hz, 3H). ¹³C-NMR (**100** MHz, CDCl₃): δ 194.2, 187.8, 155.8, 149.8, 149.7, 149.3, 144.6, 133.6, 130.0, 128.6, 127.0, 122.3, 119.4, 117.2, 62.4, 19.1. HRMS (ESI): *m*/*z* calcd for C₁₆H₁₅O₃ (M+H): 255.1021. Found: 255.1036.

(S)-2-((E)-But-2-en-1-ylidene)-3-hydroxy-2,3-dihydrocyclopenta[c]chromen-1(4H)-one (61j).

This compound was isolated as pale brown solid. Following the general procedure **11**, 22 mg of **58j** afforded 21.3 mg of **61j** (97% yield). M.P = 167-169 °C. $R_f = 0.3$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 2929, 1696, 1608, 1459, 1277, 1072, 1019, 757. ¹H-NMR (400

MHz, CDCl₃): δ 8.16-8.12 (m, 1H), 7.24-7.20 (m, 1H), 7.05 (d, J = 11.6 Hz, 1H), 6.98-6.94 (m, 1H), 6.85 (dd, J = 8.0 and 0.8 Hz, 1H), 6.69-6.28 (m, 1H), 6.37-6.30 (m, 1H), 5.41-5.35 (m, 1H), 5.26 (s, 2H), 5.25-5.19 (m, 1H), 1.98 (dd, J = 6.8 and 1.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.3, 156.9, 153.0, 143.2, 134.5, 134.1, 133.9, 130.8, 127.0, 125.2, 121.7, 116.5, 115.9, 68.5, 65.2, 19.2. **HRMS (ESI):** m/z calcd for C₁₆H₁₅O₃ (M+H)⁺: 255.1021. Found: 255.1043.

Optical rotation: $[\alpha]_{D}^{23} + 3.1$ (*c* 0.05, CHCl₃) for a sample with *ee* 95%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (95:5 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 34.6 \text{ min}, \tau_{minor} = 23.4 \text{ min}$).

2-((2E,4E)-Hexa-2,4-dienoyl)benzo[b]thiophene-3-carbaldehyde (58k).

This compound was prepared by following the general procedure **8** and isolated as a pale yellow solid. M.P = 122-124 °C. R_f = 0.5 (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3442, 3002, 1671,

1655, 1592, 1499, 1000, 751. ¹H-NMR (400 MHz, CDCl₃): δ 10.65 (s, 1H), 8.80-8.78 (m, 1H), 7.92-7.90 (m, 1H), 7.58-7.54 (m, 2H), 7.53-7.47 (m, 1H), 6.70 (d, J = 14.8 Hz, 1H), 6.40-6.39 (m, 2H), 1.96 (d, J = 5.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 188.0, 184.7, 150.7, 147.7, 144.3, 138.9, 136.6, 136.4, 130.2, 127.8, 126.9, 126.7, 125.4, 122.2, 19.1. HRMS (ESI): m/z calcd for C₁₅H₁₃O₂S (M+H): 257.0636. Found: 257.0654.

(S)-2-((E)-But-2-en-1-ylidene)-1-hydroxy-1H-benzo[b]cyclopenta[d]thiophen-3(2H)-one (61k).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 20 mg of **58k** afforded 18.3 mg of **61k** (91% yield). M.P = 127-129 °C. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3467, 2925, 1690, 1633, 1270, 1019, 760. ¹H-NMR (400 MHz,

CDCl₃): δ 8.16-8.14 (m, 1H), 7.92-7.90 (m, 1H), 7.56-7.49 (m, 2H), 7.16 (d, J = 11.6 Hz, 1H), 6.85-6.78 (m, 1H), 6.36 (sextet, J = 7.2 Hz, 1H), 5.91 (d, J = 6.5 Hz, 1H), 2.35 (d, J = 6.4 Hz, 1H), 2.00 (dd, J = 6.9 and 1.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.4, 158.9, 148.1, 145.0, 143.2, 138.9, 135.3, 133.3, 128.3, 127.2, 125.5, 124.6, 124.3, 67.0, 19.3. HRMS (ESI): m/z calcd for

 $C_{15}H_{13}O_{2}S(M+H)^{+}$: 257.0636. Found: 257.0644.

Optical rotation: $\left[\alpha\right]_{D}^{23}$ -36.3 (c 0.11, CHCl₃) for a sample with *ee* 94%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (98:2 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 13.2 \text{ min}$, $\tau_{\text{minor}} = 23.9 \text{ min}$).

2-((2E,4E)-Hexa-2,4-dienoyl)thiophene-3-carbaldehyde (58l).

This compound was prepared by following the general procedure 8 and isolated as pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm⁻¹ 2928, 1680, 1651, 1623, 1584, 1244, 1156, 732. ¹H-NMR

(400 MHz, CDCl₃): δ 10.50 (s, 1H), 7.65 (d, J = 4.9 Hz, 1H), 7.50-7.47 (m, 2H), 6.68 (d, J =14.8 Hz, 1H), 6.36-6.34 (m, 2H), 1.43 (d, J = 5.3 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 187.5, 182.8, 147.1, 146.6, 144.3, 143.5, 130.1, 129.2, 128.4, 124.6, 19.0. HRMS (ESI): m/z calcd for $C_{11}H_{11}O_2S$ (M+H)⁺: 207.0480. Found: 207.0467.

(R,E)-5-((E)-But-2-en-1-ylidene)-4-hydroxy-4H-cyclopenta[b]thiophen-6(5H)-one (611).

HO H Me This compound was isolated as Pale yellow oil. Following the general procedure 11, 20 mg of 58l afforded 19.4 mg of 61l (89% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3383, 2961, 2925, 611 (E/Z = 5:1) 1692, 1633, 1434, 1377, 1035, 732, ¹H-NMR (400 MHz, CDCl₃): δ 7.89 (d, J = 4.8 Hz, 1H), 7.30 (d, J = 4.9 Hz, 1H), 7.09 (d, J = 12.0 Hz, 1H), 6.77-6.69 (m, 1H), 6.34-6.29 (m, 1H), 5.65 (s, 1H), 2.41 (brs, 1H), 1.97 (dd, J = 8.0 and 1.5 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 184.1, 163.7, 144.6, 142.7, 140.0, 139.8, 135.4, 127.1, 123.3, 66.7, 19.2. HRMS (ESI): m/z calcd for C₁₁H₉OS (M-OH)⁺: 189.0374. Found: 189.0389.

Optical rotation: $\left[\alpha\right]^{23}$ -6.6 (*c* 0.10, CHCl₃) for a sample with *ee* 92%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (90:10 n-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{\text{major}} = 22.1 \text{ min}$, $\tau_{\text{minor}} = 33.2 \text{ min}$).

2-((2E,4E)-Hexa-2,4-dienoyl)nicotinaldehyde (58m).

This compound was prepared by following the general procedure **6** and isolated as pale brown solid. M.P = 114-116 °C. $R_f = 0.4$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3009, 1700, 1662, 1574, 1275, 997,

750. ¹H-NMR (400 MHz, CDCl₃): δ 10.49 (s, 1H), 8.86-8.85 (m, 1H), 8.23 (d, J = 7.6 Hz, 1H), 7.60 (dd, J = 7.6 and 4.8 Hz, 1H), 7.55-7.49 (m, 1H), 7.33 (d, J = 15.6 Hz, 1H), 6.41-6.37 (m, 2H), 1.94 (d, J = 5.6 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.2, 190.8, 156.0, 151.9, 147.0, 143.1, 136.3, 133.0, 130.8, 126.2, 123.5, 19.1. HRMS (ESI): m/z calcd for C₁₂H₁₂NO₂ (M+H): 202.0868. Found: 202.0881.

(S)-6-((E)-But-2-en-1-ylidene)-5-hydroxy-5H-cyclopenta[b]pyridin-7(6H)-one (61m).

This compound was isolated as Pale brown solid. Following the general procedure **11**, 20 mg of **58m** afforded 17.7 mg of **61m** (88% yield). M.P = 123-125 °C. $R_f = 0.2$ (Hexane/EtOAc = 5/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3417, 2834, 1659, 1651, 1025, 999, 764. ¹H-NMR (400 MHz, (CD₃)₂SO): δ 8.81-8.80 (m, 1H), 8.21-8.19 (m, 1H), 7.68 (dd, J = 8.0 and 6.9 Hz, 1H), 7.20 (d, J = 7.0 Hz, 1H), 6.84-6.76 (m, 1H), 6.53-6.47 (m, 1H), 6.00 (d, J = 8.4 Hz, 1H), 5.67 (d, J = 8.1 Hz, 1H), 1.94 (d, J = 6.8 Hz, 3H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 191.5, 154.6, 152.2, 148.1, 144.0, 137.0, 136.8, 135.5, 128.6, 128.4, 65.9, 19.6. HRMS (ESI): m/z calcd for C₁₂H₁₀NO (M-OH): 184.0762. Found: 184.0756.

Optical rotation: $[\alpha]_{D}^{23} + 39.2$ (*c* 0.05, DMSO) for a sample with *ee* 96%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (87:13 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 9.2 \text{ min}, \tau_{minor} = 11.8 \text{ min}$).

2-((2E,4E)-3-Methyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (58n).

This compound was prepared by following the general procedure **6** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2922, 1694, 1654, 1575, 1246, 968, 725. ¹H-NMR (400

MHz, CDCl₃): δ 10.28 (s, 1H), 7.96 (d, J = 7.6 Hz, 1H), 7.74-7.72 (m, 1H), 7.68-7.52 (m, 4H), 7.41-7.28 (m, 3H), 7.14 (d, J = 16.0 Hz, 1H), 6.93 (d, J = 16.0 Hz, 1H), 6.78 (s, 1H), 2.52 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.8, 191.8, 153.9, 143.8, 136.7, 136.1, 135.8, 133.0,

132.0, 129.1, 128.9(2C), 128.8, 128.1, 127.3(2C), 125.9, 124.0, 14.7. **HRMS (ESI):** m/z calcd for C₁₉H₁₇O₂ (M+H)⁺: 277.1229. Found: 277.1216.

(E)-3-Hydroxy-2-((E)-4-phenylbut-3-en-2-ylidene)-2,3-dihydro-1*H*-inden-1-one (61n).

This compound was isolated as Pale yellow solid. Following the general procedure **10**, 40 mg of **58n** afforded 36.5 mg of **61n** (91% yield). M.P = 127-129 °C. $R_f = 0.2$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3400, 2924, 1668, 1605, 1579, 1336, 1094, 751. ¹H-NMR (400 MHz,

CDCl₃): δ 7.74-7.70 (m, 2H), 7.65-7.53 (m, 4H), 7.42-7.28 (m, 4H), 7.12 (d, J = 16.0 Hz, 1H), 5.8 (s, 1H), 2.92 (brs, 2.50 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.7, 149.7, 149.3, 131.9, 137.6, 136.5, 135.3, 134.9, 129.2, 128.8(2C), 128.5, 127.6(2C), 125.8, 125.7, 123.2, 69.9, 13.3. **HRMS (ESI):** m/z calcd for C₁₉H₁₇O₂ (M+H)⁺: 277.1229. Found: 277.1215.

Data of the pure *E***-isomer of 61n:** ¹**H-NMR (400 MHz, CDCl₃):** δ 8.82 (dd, *J* = 16.1 and 3.2 Hz, 1H), 7.68 (d, *J* = 7.6 Hz, 1H), 7.57-7.51 (m, 4H), 7.41-7.31 (m, 4H), 7.00 (d, *J* = 16.1 Hz, 1H), 5.63 (s, 7.2 Hz, 1H), 2.89 (d, *J* = 7.1 Hz, 1H), 2.36 (s, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 193.0, 150.3, 149.9, 138.9, 136.8, 136.7, 134.8, 134.7, 129.3, 128.9, 128.7(2C), 127.8(2C), 126.4, 125.6, 123.1, 70.5, 16.2.

(2E,4E)-1-(3-Acetylbenzo[b]thiophen-2-yl)hexa-2,4-dien-1-one (58o).

This compound was prepared by following the general procedure **9** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat): max/cm⁻¹ 3444, 3064, 2918, 1699, 1652, 1585, 1510, 1140,

757. ¹H-NMR (400 MHz, CDCl₃): δ 7.89 (d, J = 8.0 Hz, 1H), 7.85 (d, J = 7.9 Hz, 1H), 7.52-7.47 (m, 3H), 6.67 (d, J = 14.8 Hz, 1H), 6.37-6.35 (m, 2H), 2.62 (s, 3H), 1.94 (d, J = 4.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 200.9, 184.0, 146.9, 143.5, 142.1, 140.5, 136.7, 130.2, 127.6, 125.8, 125.2, 124.5, 124.3, 122.7, 31.5, 19.1. HRMS (ESI): m/z calcd for C₁₆H₁₅O₂S (M+H): 271.0793. Found: 271.0793.

(*E*)-2-((*E*)-But-2-en-1-ylidene)-1-hydroxy-1-methyl-1*H*-benzo[*b*]cyclopenta[*d*]thiophen-3(2*H*)-one (610).

This compound was isolated as light yellow semi solid. Following the general procedure **10**, 20 mg of **580** afforded 17.8 mg of **610** (89% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). IR (thin film, neat): max/cm⁻¹ 3387, 2929, 1681, 1632, 1267, 1041, 735. ¹H-NMR (400 MHz, CDCl₃): δ 8.18-8.15

(m, 1H), 7.93-7.90 (m, 1H), 7.53-7.49 (m, 2H), 7.03 (d, J = 12.0 Hz, 1H), 6.97-6.93 (m, 1H), 6.34-6.28 (m, 1H), 2.61 (br s, 1H), 2.00 (dd, J = 6.7 and 1.6 Hz, 3H), 1.96 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 185.1, 162.8, 148.3, 143.0, 142.8, 133.4, 132.2, 128.8, 127.2, 126.5, 125.3, 125.0, 124.4, 74.7, 26.1, 19.3. HRMS (ESI): m/z calcd for C₁₆H₁₅O₂S (M+H)⁺: 271.0793. Found: 271.0782.

(2E,4E)-1-(2-Benzoylphenyl)hexa-2,4-dien-1-one (58p).

This compound was prepared by following the general procedure **6** and isolated as pale brown oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). IR (thin film, neat): max/cm⁻¹ 3451, 3061, 2930, 1664, 1587, 1448, 1284, 704. ¹H-NMR (400 MHz, CDCl₃): δ 7.79-7.77 (m, 3H), 7.61-7.56 (m, 2H), 7.55-7.48 (m, 2H), 7.44-7.40 (m, 2H), 7.16-7.10 (m, 1H), 6.56 (d, J = 15.1 Hz, 1H), 6.24-6.17 (m, 2H), 1.86 (d, J = 6.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.4, 192.5, 146.5, 141.7, 140.6, 139.3, 137.2, 132.9, 131.0, 130.3, 129.9, 129.6(2C), 128.7, 128.6, 128.3(2C), 125.1, 18.9. HRMS (ESI): m/z calcd for $C_{19}H_{17}O_2$ (M+H): 277.1229. Found: 277.1244.

(E)-2-((E)-But-2-en-1-ylidene)-3-hydroxy-3-phenyl-2,3-dihydro-1*H*-inden-1-one (61p).

This compound was isolated as pale yellow sticky oil. Following the general procedure **10**, 25 mg of **58p** afforded 23 mg of **61p** (92% yield). $R_f = 0.2$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** max/cm⁻¹ 3413, 2929, 1687,

1624, 1288, 982, 699. ¹H-NMR (400 MHz, CDCl₃): δ 7.75 (d, J = 8.4 Hz, 1H), 7.65 (dt, J = 11.6 and 1.2 Hz, 1H), 7.50 (dt, J = 7.7 and 0.9 Hz, 1H), 7.37-7.33 (m, 3H), 7.31-7.27 (m, 2H), 7.21-7.17 (m, 1H), 7.04 (d, J = 10.6 Hz, 1H), 6.56 (s, 1H), 6.36-6.29 (m, 2H), 1.72 (d, J = 5.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.7, 157.3, 145.9, 143.1, 142.2, 136.4, 136.0, 134.6,

129.4, 128.6(2C), 127.8, 127.0, 125.7, 125.5(2C), 122.9, 77.6, 19.5. **HRMS (ESI):** *m*/*z* calcd for C₁₉H₁₅O (M-OH): 259.1123. Found: 259.1143.

2-((2E,4E)-5-Phenylhexa-2,4-dienoyl)benzaldehyde (58q).

This compound was prepared by following the general procedure **6** and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3379, 3058, 1695, 1651, 1578, 1445, 1291, 1022, 761. ¹H-

NMR (400 MHz, CDCl₃): δ 10.22 (s, 1H), 8.02 (d, J = 7.3 Hz, 1H), 7.74-7.66 (m, 3H), 7.55-7.53 (m, 2H), 7.42-7.35 (m, 4H), 6.82 (d, J = 15.4 Hz, 1H), 6.73 (d, J = 7.5 Hz, 1H), 2.30 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.9, 191.4, 148.7, 142.7, 142.2, 141.6, 135.7, 133.1, 131.0, 129.2, 128.8, 128.6(2C), 128.4, 128.3, 126.0(2C), 125.2, 16.8. HRMS (ESI): m/z calcd for C₁₉H₁₇O₂ (M+H)⁺: 277.1229. Found: 277.1223.

(E)-3-Hydroxy-2-((E)-3-phenylbut-2-en-1-ylidene)-2,3-dihydro-1*H*-inden-1-one (61q).

This compound was isolated as pale yellow solid. Following the general procedure **10**, 25 mg of **58q** afforded 22 mg of **61q** (87% yield). M.P = 158- **61q** (*E*/*Z* = 4:1) This compound was isolated as pale yellow solid. Following the general procedure **10**, 25 mg of **58q** afforded 22 mg of **61q** (87% yield). M.P = 158- **160** °C. R_f = 0.4 (Hexane/EtOAc = 3/1). **IR** (thin film, neat): v_{max}/cm^{-1} **3416**, 3006, 1681, 1610, 1275, 749. ¹**H-NMR** (**400 MHz, CDCl₃**): δ 7.80-7.75 (m, 1H), 7.70 (t, J = 7.2 Hz, 1H), 7.62-7.60 (m, 2H), 7.50-7.37 (m, 6H), 7.29-7.25 (m, 1H), 5.83 (s, 1H), 2.48 (br s, 1H), 2.39 (s, 3H). ¹³**C-NMR** (**100 MHz, CDCl₃**): δ 192.2, 151.0, 149.9, 141.9, 138.2, 138.0, 135.2, 132.8, 129.6, 128.8, 128.5(2C), 126.2(2C), 125.9, 123.5, 122.4, 69.1, 16.5. **HRMS** (**ESI**): m/z calcd for C₁₉H₁₅O (M-OH): 259.1123. Found: 259.1136.

2-((2E,4Z)-4-(Chroman-4-ylidene)but-2-enoyl)benzaldehyde (58r).

This compound was prepared by following the general procedure **6** and isolated as pale brown oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2925, 1694, 1646, 1578, 1481, 1276, 750. ¹H-NMR (400

MHz, CDCl₃): δ 10.22 (s, 1H), 8.01 (d, J = 7.2 Hz, 1H), 7.71-7.64 (m, 5H), 7.28-7.26 (m, 1H), 6.98-6.95 (m, 1H), 6.92-6.87 (m, 2H), 6.84 (d, J = 15.2 Hz, 1H), 4.27 (t, J = 6.0 Hz, 2H), 2.90 (t, J = 6.1 Hz, 2H). ¹³C-NMR (100 MHz, CDCl₃): δ 193.4, 191.4, 156.0, 142.2, 141.4, 141.2,

135.7, 133.2, 131.2, 131.0, 129.2, 128.3, 128.1, 124.4, 121.5, 121.2, 118.8, 118.0, 65.6, 26.5. **HRMS (ESI):** m/z calcd for C₂₀H₁₇O₃ (M+H): 305.1178. Found: 305.1163.

(E)-2-((Z)-2-(Chroman-4-ylidene)ethylidene)-3-hydroxy-2,3-dihydro-1H-inden-1-one (61r).

This compound was isolated as Pale brown solid. Following the general procedure 10, 25 mg of 58r afforded 22 mg of 61r (89% yield). M.P =166-168 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3400, 3002, 1683, 1609, 1260, 750. ¹H-NMR (400 MHz, CDCl₃): δ 7.82-7.78 (m, 3H), 7.72-7.63 (m, 2H), 7.49 (t, J = 8.0 Hz, 1H), 7.43-7.40 (m, 1H), 7.28-7.24 (m, 1H), 6.97 (dt, J = 6.9 and 1.2 Hz, 1H), 6.90 (dd, J = 8.0 and 1.1 Hz, 1H), 5.85 (s, 1H), 4.27 (t, J = 6.0 Hz, 2H), 3.01-2.97 (m, 2H), 2.62 (br s, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 192.0, 156.0, 151.1, 142.0, 138.1, 137.9, 135.1, 131.6, 131.2, 129.6, 125.9, 124.9, 123.5, 121.9, 121.2, 117.9, 116.2, 69.1, 65.7, 26.3. **HRMS (ESI):** *m*/*z* calcd for C₂₀H₁₅O₂ (M-OH): 287.1072. Found: 287.1099.

(E)-2-(5,5-Diphenylpenta-2,4-dienoyl)benzaldehyde (58s).

This compound was prepared by following the general procedure 6 and isolated as pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm⁻¹ 3378, 3057, 2854, 1696, 1647, 1577, 1445, 1278, 1023,

772, 700. ¹H-NMR (400 MHz, CDCl₃): δ 10.15 (s, 1H), 7.95-7.93 (m, 1H), 7.64-7.58 (m, 2H), 7.40-7.17 (m, 12H), 6.93 (d, J = 11.2 Hz, 1H), 6.85 (dd, J = 15.2 and 0.6 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.1, 191.2, 153.8, 145.1, 142.0, 141.0, 138.2, 135.5, 133.1, 130.8, 130.4(2C), 129.6, 129.2, 129.1, 128.6, 128.5(2C), 128.4(2C), 128.3(2C), 125.5. HRMS (ESI): *m/z* calcd for C₂₄H₁₉O₂ (M+H): 339.1385. Found: 339.1392.

(S)-2-(3,3-Diphenylallylidene)-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (61s).

This compound was isolated as pale yellow solid. Following the general procedure 11, 25 mg of 58s afforded 23 mg of 61s (92% yield). M.P = 162-164 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3395, 3056, 1681, 1610, 1275, 749. ¹H-NMR (400 MHz, CDCl₃): δ 7.80 (d, J = 6.5 Hz, 2H), 7.70-7.66 (m, 1H), 7.50-7.34 (m, 11H), 7.28-7.25 (m, 2H), 5.88 (d, J = 7.2 Hz, 1H), 2.39 (d, J = 7.1 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.7, 154.2, 150.8, 141.5, 139.2, 138.3, 138.2,

135.1, 134.5, 130.6(2C), 129.6, 129.1, 128.6, 128.5(2C), 128.4(2C), 128.3 (2C), 125.9, 123.5, 122.9, 69.2. **HRMS (ESI):** m/z calcd for C₂₄H₁₇O (M-OH): 321.1279. Found: 321.1283. **Optical rotation:** $[\alpha]_{D}^{23} + 20.5$ (*c* 0.05, CHCl₃) for a sample with *ee* 97%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AS Column (90:10 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 44.5 \text{ min}, \tau_{minor} = 20.7 \text{ min}$).

(E)-2-(5,5-Diphenylpenta-2,4-dienoyl)-5-methoxybenzaldehyde (58t).

This compound was prepared by following the general procedure **6** and isolated as pale brown oil. $R_f = 0.4$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3055, 1690, 1595, 1577, 1444, 1276,

1018, 765. ¹H-NMR (400 MHz, CDCl₃): δ 10.22 (s, 1H), 7.75-7.70 (m, 1H), 7.44-7.36 (m, 11H), 7.24-7.21 (m, 1H), 7.15-7.11 (m, 1H), 7.01-6.95 (m, 2H), 3.98 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 191.7, 191.5, 161.9, 153.4, 144.0, 141.2, 138.9, 138.4, 134.3, 130.8, 130.4(2C), 129.1, 128.7, 128.6, 128.5(2C), 128.4(2C), 128.3(2C), 125.7, 118.8, 112.3, 55.8. HRMS (ESI): *m/z* calcd for C₂₅H₂₁O₃ (M+H): 369.1491. Found: 369.1479.

(S)-2-(3,3-Diphenylallylidene)-3-hydroxy-5-methoxy-2,3-dihydro-1*H*-inden-1-one (61t).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 15 mg of **58t** afforded 13 mg of **61t** (88% yield). M.P = 191-193 °C. $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR** (thin film, neat):

 v_{max} /cm⁻¹ 3006, 2919, 1691, 1609, 1275, 1260, 750. ¹H-NMR (400 MHz, (CD₃)₂SO): δ 7.63 (d, J = 8.8 Hz, 1H), 7.54-7.50 (m, 4H), 7.43-7.35 (m, 5H), 7.25-7.23 (m, 3H), 7.07 (dd, J = 8.6 and 2.2 Hz, 1H), 6.96 (dd, J = 8.1 and 1.4 Hz, 1H), 6.15 (d, J = 8.0 Hz, 1H), 5.78 (d, J = 7.9 Hz, 1H), 3.91 (s, 3H). ¹³C-NMR (100 MHz, (CD₃)₂SO): δ 190.1, 165.6, 156.0, 151.2, 141.9, 141.3, 138.5, 131.2, 130.7, 130.5(2C), 129.4, 129.1(2C), 129.0(2C), 128.9, 128.2(2C), 125.0, 123.7, 117.3, 169.9, 67.7, 56.3. HRMS (ESI): m/z calcd for C₂₅H₁₉O₂ (M-OH): 351.1385. Found: 351.1399.

Optical rotation: $[\alpha]_{D}^{23} + 20.2$ (*c* 0.30, CHCl₃) for a sample with *ee* 97%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralpak AD Column (94:6 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 39.8 \text{ min}, \tau_{minor} = 30.2 \text{ min}$).

(E)-1-(5,5-Diphenylpenta-2,4-dienoyl)-2-naphthaldehyde (58u).

This compound was prepared by following the general procedure **6** and isolated as pale yellow solid. M.P = 122-124 °C. $R_f = 0.4$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3007, 1695, 1641, 1604, 1275,

1260, 749. ¹**H-NMR** (**400 MHz, CDCl₃**): δ 10.17 (s, 1H), 7.93-7.89 (m, 3H), 7.69-7.61 (m, 2H), 7.36-7.19 (m, 7H), 7.07 (t, J = 7.6 Hz, 2H), 6.92-6.84 (m, 5H). ¹³**C-NMR** (**100 MHz, CDCl₃**): δ 197.9, 190.5, 154.3, 147.2, 147.1, 143.5, 140.8, 137.8, 136.0, 132.5, 130.4, 130.3, 129.7, 129.6, 129.3, 129.2(2C), 128.4(2C), 128.3(2C), 127.9, 127.6(2C), 126.7, 125.2, 122.9. **HRMS (ESI)**: m/z calcd for C₂₈H₂₁O₂ (M+H): 389.1542. Found: 389.1546.

(S)-2-(3,3-Diphenylallylidene)-3-hydroxy-2,3-dihydro-1*H*-cyclopenta[*a*]naphthalen-1-one (61u).

This compound was isolated as pale yellow solid. Following the general procedure **11**, 24 mg of **58u** afforded 23 mg of **61u** (95% yield). M.P = 147-149 °C. $R_f = 0.2$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3418, 3056, 1681, 1609, 1275, 1173, 749. ¹H-NMR (400 MHz,

CDCl₃): δ 9.19-9.17 (m, 1H), 8.14-8.10 (m, 1H), 7.93-7.89 (m, 1H), 7.83-7.78 (m, 1H), 7.71-7.57 (m, 2H), 7.54-7.21 (m, 12H), 5.91 (s, 1H), 2.40 (br s, 1H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 192.5, 153.5, 152.73, 152.71, 141.5, 139.5, 138.3, 136.4, 139.5, 136.4, 133.1, 130.6(2C), 129.1, 129.0, 128.9, 128.5(2C), 128.4(4C), 128.3, 127.4, 125.0, 122.9, 122.4, 69.0. **HRMS (ESI):** m/z calcd for C₂₈H₁₉O (M–OH): 371.1436. Found: 371.1453. **Optical rotation:** $[\alpha]^{23}_{D}$ +114.7 (*c* 0.18, CHCl₃) for a sample with *ee* 89%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (95:5 *n*-Hexane/2-Propanol, 1.0 mL/min, 254 nm, $\tau_{major} = 59.6 \text{ min}, \tau_{minor} = 37.8 \text{ min}$).

(E)-4-(5,5-Diphenylpenta-2,4-dienoyl)-2H-chromene-3-carbaldehyde (58v).

This compound was prepared by following the general procedure **7** and isolated as pale brown sticky oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3058, 2855, 1759, 1672, 1602, 1445, 1275,

751. ¹**H-NMR (400 MHz, CDCl₃):** δ 9.66 (s, 1H), 7.40-7.35 (m, 4H), 7.34-7.28 (m, 4H), 7.27-7.25 (m, 2H), 7.12 (dd, J = 8.0 and 1.6 Hz, 1H), 7.01-6.98 (m, 3H), 6.93 (dd, J = 8.0 and 0.8 Hz,

1H), 6.89 (d, J = 11.6 Hz, 1H), 6.61 (d, J = 15.2 Hz, 1H), 4.90 (s, 2H). ¹³C-NMR (100 MHz, CDCl₃): δ 194.1, 187.8, 155.7, 155.5, 149.4, 148.1, 140.7, 137.8, 133.5, 130.5, 130.4(2C), 129.5, 128.9, 128.6(2C), 128.5(2C), 128.3(2C), 127.2, 126.9, 124.9, 122.1, 119.4, 117.1, 62.1. HRMS (ESI): m/z calcd for C₂₇H₂₁O₃ (M+H)⁺: 393.1491. Found: 393.1473.

(*S*,*E*)-2-(3,3-Diphenylallylidene)-3-hydroxy-2,3-dihydrocyclopenta[*c*]chromen-1(4*H*)-one (61v).

This compound was isolated as light yellow liquid. Following the general procedure **11**, 20 mg of **58v** afforded 18.3 mg of **61v** (91% yield, E/Z = 6:1). R_f = 0.3 (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm⁻¹ 3437, 2924, 1634, 1614, 1269, 760. ¹H-NMR (**400 MHz, CDCl**₃): δ 8.11 (dd, J

= 7.8 and 0.8 Hz, 1H),7.44-7.43 (m, 3H), 7.36-7.35 (m, 5H), 7.32-7.28 (m, 2H), 7.26-7.19 (m, 3H), 6.96-6.93 (m, 1H), 6.92-6.83 (m, 1H), 5.42-5.20 (m, 3H), 2.07 (br s, 1H) . ¹³C-NMR (100 MHz, CDCl₃): δ 189.9, 156.7, 153.8, 153.0, 141.4, 138.1, 136.9, 134.1, 131.8, 130.6(2C), 129.0, 128.6, 128.4(6C), 125.2, 122.3, 121.7, 116.5, 115.9, 68.7, 65.2. HRMS (ESI): *m*/*z* calcd for C₂₇H₂₁O₃ (M+H)⁺: 393.1491. Found: 393.1474.

Optical rotation: $[\alpha]_{D}^{23}$ +49.9 (*c* 0.10, CHCl₃) for a sample with *ee* 98%. The enantiomeric excess was determined by HPLC analysis using Daicel Chiralcel OD-H Column (93:7 *n*-Hexane/2-Propanol, 0.8 mL/min, 254 nm, $\tau_{major} = 35.7 \text{ min}, \tau_{minor} = 32.3 \text{ min}$).

General procedure 12: Synthesis of *E*,*Z*-58b

Step I: An oven dried 25 mL RB flask was charged with sodium hydride (60% oil dispersion, 5.2 mmol), 10 mL dry THF and placed at 0 °C. To this suspension, triethyl phosphonoacetate **73** (5.1 mmol) was added dropwise under argon atmosphere at same temperature and stirred until the effervescence of hydrogen gas ceased. Phenyl propiolaldehyde **72** (5.0 mmol) dissolved in 1 mL of dry THF was added dropwise over 2 min and continued stirring for 30 min. The reaction mixture was quenched with saturated aq. NH₄Cl solution and extracted using ethyl acetate. The organic extracts were combined dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford **74** as colorless oil.

Step II: In an oven dried 10 mL RB flask the ester **74** (1 mmol) was dissolved in 1 mL dry methanol. Quinoline (0.15 mmol) and Lindlar's catalyst (0.1 mmol) were introduced to the reaction mixture. The reaction mixture was evacuated and refilled with hydrogen gas (3 times) and stirred at room temperature. The reaction mixture was followed carefully to avoid over-reduction. After completion of the reaction (by TLC), the reaction mixture was filtered through a celite pad and the filtrate was extracted using ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford **75** as pale yellow oil.

Step III: An oven dried 50 mL RB flask was charged with **75** (4.0 mmol), 10 mL dry THF and placed at 0 $^{\circ}$ C. To the reaction mixture DIBAL-H (8.2 mmol) was added drop wise at the same temperature and allowed to stir at rt for 5 h. The reaction mixture was quenched with saturated aq. NH₄Cl solution and the resultant mixture was filtered through Buchner funnel, the filtrate was extracted using ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated to afford the crude alcohol as pale yellow oil. The crude alcohol was further subjected to IBX oxidation to afford the aldehyde **76** as yellow solid.

Step IV: An oven dried 25 mL long neck RB flask was charged with 2-(2-bromophenyl)-1,3dioxolane **77** (1.0 mmol), 5 mL dry THF and placed at -78 °C. A hexane solution of *n*-BuLi (1.2 mL, 3.2 mmol) was added and the mixture was stirred for an additional 45 mins. The dienal **76** (1.1 mmol) dissolved in 1 mL dry THF, was added dropwise over 5 min. The mixture was warmed to room temperature. The reaction progress was monitored by TLC. Reaction mixture was quenched with saturated aqueous ammonium chloride solution and extracted with ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford dienol **78**.

Step V: The IBX oxidation (as described in general procedure 1, Step II) of alcohol **78** delivered the crude dienone and subsequently subjected to p-TSA (0.2 mmol) mediated acetal deprotection in acetone. The reaction mixture was quenched with saturated aq. Sodium bicarbonate and extracted using ethylacetate. The crude product was purified by flash chromatography using hexane/ethyl acetate to afford *E*,*Z*-**58b** as a pale yellow oil.

General Procedure 13: One-pot telescopic synthesis of 3,4-disubstituted fluorenones 85

Step-I: An oven dried 5 mL glass vial was charged with **61** (30 mg, 0.15 mmol), acetylacetone (0.2 mmol) in dichloroethane (DCE, 1 mL) and bismuth(III)chloride (10 mol%) was introduced at room temperature (rt). Stirring continued at RT until **61** disappeared as monitored by TLC. Reaction mixture was quenched with water and extracted using dichloromethane. Volatiles were removed under reduced pressure. The crude product **80** was subjected to next step without further purification.

Step-II: An oven dried 5 mL glass vial was charged with **80** (0.1 mmol) in dimethylformamide (DMF, 1 mL) and potassium carbonate (0.11 mmol) was introduced at room temperature (rt) and stirring continued at 60 °C until **80** disappeared as monitored by TLC. The crude reaction mixture was purified by silica gel flash chromatography using hexanes/ethyl acetate as eluent, to afford **85**.

4-Acetyl-3-methyl-9H-fluoren-9-one (85a).

This compound was isolated as pale yellow solid. Following the general procedure **13**, 30 mg of **61a** afforded 16 mg of **85a** (46% yield, over two steps). M.P = 150-152 °C. $R_f = 0.5$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 2924, 2854, 1714, 1695, 1357, 1111, 752. ¹H-NMR (400 MHz,

CDCl₃): δ 7.70 (d, J = 7.3 Hz, 1H), 7.61 (d, J = 7.6 Hz, 1H), 7.46 (dt, J = 7.6 and 1.1 Hz, 1H), 7.35-7.28 (m, 2H), 7.71 (d, J = 7.6 Hz, 1H), 2.67 (s, 3H), 2.35 (s, 3H). ¹³C-NMR (100 MHz, **CDCl₃**): δ 206.7, 192.5, 142.5, 139.8, 139.2, 137.2, 134.7, 134.6, 132.5, 130.9, 129.4, 124.6, 124.5, 122.1, 32.3, 19.3. **HRMS (ESI)**: m/z calcd for C₁₆H₁₁O₂ (M-H)⁺: 235.0759. Found: 235.0750.

4-Acetyl-3-phenyl-9H-fluoren-9-one (85b).

This compound was isolated as pale yellow solid. Following the general procedure **13**, 25 mg of **61b** afforded 12 mg of **85b** (43% yield, over two steps). M.P = 115-117 °C. $R_f = 0.5$ (Hexane/EtOAc = 5/1). IR (thin film, neat): v_{max}/cm^{-1} 2993, 1715, 1698, 1606, 1576, 1412, 1275, 1259, 749. ¹H-

NMR (400 MHz, CDCl₃): δ 7.78 (d, *J* = 7.6 Hz, 1H), 7.73 (dd, *J* = 7.4 and 0.8 Hz, 1H), 7.48-7.41 (m, 7H), 7.36 (d, *J* = 7.6 Hz, 1H), 7.35 (dt, *J* = 7.6 and 1.3 Hz, 1H), 2.11 (s, 3H). ¹³C-NMR

(100 MHz, CDCl₃): δ 206.3, 192.5, 144.8, 142.8, 142.6, 139.7, 138.9, 136.5, 135.0, 134.5, 133.6, 130.7, 129.5, 128.9(2C), 128.8(2C), 128.7, 124.7, 124.5, 122.6, 32.0. HRMS (ESI): m/z calcd for C₂₁H₁₃O₂ (M-H)⁺: 297.0916. Found: 297.0903.

4-Acetyl-6-fluoro-3-methyl-9H-fluoren-9-one (85c).

This compound was isolated as off white solid. Following the general procedure **13**, 25 mg of **61e** afforded 15 mg of **85c** (50% yield). M.P = 110-112 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 2990, 1714, 1690, 1612, 1584, 1275, 1260, 750. ¹H-NMR (400 MHz, CDCl₃): δ

7.70 (dd, J = 8.0 and 2.8 Hz, 1H), 7.61 (d, J = 8.0 Hz, 1H), 7.21 (7.7 Hz, 1H), 7.01-6.96 (m, 2H), 2.67 (s, 3H), 2.37 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 206.1, 190.7, 165.7 (d, J = 254.1 Hz), 145.4 (d, J = 9.7 Hz), 139.9, 137.53, 137.51, 132.9, 131.6, 130.6 (d, J = 2.5 Hz), 126.5 (d, J = 10.2 Hz), 124.5, 115.8 (d, J = 23.2 Hz), 110.4 (d, J = 25.0 Hz), 32.2, 19.3. ¹⁹F-NMR (376 MHz, CDCl₃): δ -101.9. HRMS (ESI): m/z calcd for C₁₆H₁₂FO₂ (M+H)⁺: 255.0821. Found: 255.0819.

4-Acetyl-6-methoxy-3-methyl-9H-fluoren-9-one (85d).

This compound was isolated as pale yellow solid. Following the general procedure **13**, 30 mg of **61f** afforded 15 mg of **85d** (44% yield). M.P = 116-117 °C. $R_f = 0.3$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 2928, 1704, 1688, 1612, 1584, 1363, 1228, 782. ¹H-NMR (400 MHz,

CDCl₃): δ 7.67 (d, J = 8.2 Hz, 1H), 7.58 (d, J = 7.7 Hz, 1H), 7.17 (d, J = 7.7 Hz, 1H), 6.81 (d, J = 2.0 Hz, 1H), 6.77 (dd, J = 8.2 and 2.0 Hz, 1H), 3.89 (s, 3H), 2.67 (s, 3H), 2.37 (s, 3H). ¹³C-**NMR (100 MHz, CDCl₃):** δ 206.5, 191.1, 165.2, 144.9, 139.2, 138.0, 137.2, 133.7, 131.1, 129.6, 126.5, 124.1, 112.5, 109.7, 55.8, 32.3, 19.2. HRMS (ESI): m/z calcd for C₁₇H₁₅O₃ (M+H)⁺: 267.1021. Found: 267.1009.

5-Acetyl-2,3-dimethoxy-6-methyl-9H-fluoren-9-one (85e).

This compound was isolated as pale yellow solid. Following the general procedure **13**, 35 mg of **61h** afforded 16 mg of **85e** (43% yield). M.P = 178-180 °C. $R_f = 0.3$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 2926, 1704, 1681, 1609, 1480, 1276, 749. ¹H-NMR (400 MHz,

CDCl₃): δ 7.50 (d, J = 7.6 Hz, 1H), 7.23 (s, 1H), 7.07 (d, J = 7.6 Hz, 1H), 6.78 (s, 1H), 3.96 (s, 3H), 3.95 (s, 3H), 2.67 (s, 3H), 2.33 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 206.8, 191.8, 154.2, 149.8, 139.3, 138.8, 137.4, 136.1, 133.2, 129.9, 127.7, 124.0, 107.2, 105.3, 56.29, 56.28, 32.3,

19.3. **HRMS (ESI):** m/z calcd for C₁₈H₁₇O₄ (M+H)⁺: 297.1127. Found: 297.1123.

7-Acetyl-8-methyl-11*H*-benzo[*a*]fluoren-11-one (85f).

This compound was isolated as pale yellow solid. Following the general procedure **13**, 40 mg of **61i** afforded 22 mg of **85f** (48% yield). M.P = 162-164 °C. $R_f = 0.4$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 2935, 1702, 1692, 1604, 1581, 1280, 1060, 761. ¹H-NMR (400 MHz,

CDCl₃): δ 9.02 (d, J = 8.5 Hz, 1H), 7.95 (J = 8.4 Hz, 1H), 7.80 (d, J = 8.1 Hz, 1H), 7.64-7.62 (m, 1H), 7.55 (d, J = 7.7 Hz, 1H), 7.49-7.46 (m, 1H), 7.41 (d, J = 8.1 Hz, 1H), 7.14 (d, J = 7.8 Hz, 1H), 2.71 (s, 3H), 2.34 (s, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 206.8, 194.0, 144.3, 139.2, 138.6, 137.0, 135.8, 134.3, 132.9, 130.9, 130.2, 129.6, 128.3, 127.6, 126.8, 124.4, 123.9, 119.4, 32.6, 19.2. **HRMS (ESI):** m/z calcd for C₂₀H₁₅O₂ (M+H)⁺: 287.1072. Found: 287.1076.

General Procedure 14: Synthesis of α -substituted dienones 86

Step-I: The alcohol 50 was synthesized by following the general procedure 2, Step I.

Step-II: An oven dried 25 mL long neck RB flask was charged with 2-bromo alcohol **50** (1.0 mmol), dry THF (5 mL) and placed at -78 °C. *n*-BuLi (1.6 *M* in hexanes, 2.2 mmol) was added drop wise at the same temperature and stirred for an hour. Then, α -substituted dienal **90** (1.3 mmol) dissolved in 1 mL of dry THF was added dropwise over 2 mins and stirred at room temperature for 30 mins. The reaction mixture was quenched with saturated aq. NH₄Cl solution and extracted using ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated. The product was purified by silica gel column chromatography using hexane/ethyl acetate (10:3) as eluent to afford the diol **89**.

Step-III: The diol **89** (1.0 mmol) was dissolved in ethyl acetate (10 mL) and IBX (2.2 mmol) was added. The resulting suspension was immersed in an oil bath set to 75 °C and stirred until diol C disappeared as monitored by TLC. The reaction mixture was cooled to room temperature and filtered through a Buchner funnel. The filter cake was washed with 3×5 mL of ethyl acetate.

Organic extracts were combined and washed with saturated sodium bicarbonate solution to remove excess iodobenzoic acid. The extract was dried over anhydrous sodium sulphate and concentrated under vacuum. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate (1:10) as eluent to afford the a-substituted dienone-aldehydes **86**.

General procedure 15: Synthesis of benzothiophene based dienone 86m.

Step-I: To a solution of *N*-methylpiperazine (NMP, 0.18 mL, 1.6 mmol) in THF (5 mL) at -78 °C was added *n*-BuLi (1.6*M* in hexane, 1.0 mL, 1.6 mmol). After 15 min, benzothiophene-3-carboxaldehyde **44a** (200 mg, 1.2 mmol) was added, and then the reaction mixture was stirred for an additional 30 min. A hexane solution of *n*-BuLi (2.0 mL, 3.2 mmol) was added, and the mixture was stirred for an additional 15 min, and then the mixture was warmed to -30 °C in 2 h. The solution was again cooled to -78 °C, and dienal **90a** (1.5 mmol) was added dropwise over 5 min. The mixture was warmed to room temperature over 30 min. The reaction progress was monitored by TLC. The reaction mixture was quenched with saturated aqueous ammonium chloride solution and extracted with ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford dienol **91**.

Steps-II: IBX oxidation of alcohol **91** was performed by following the general procedure 14, Step III to afford the dienone **86m**.

General Procedure 16: Synthesis of cyclopenta-fused arenes and heteroarenes via RAR

An oven dried 5 mL glass vial was charged with **86** (30 mg, 0.11 mmol). DMF (1 mL), water (3.3 mmol) and PBu₃ (1.3 mmol) were introduced at room temperature (rt) and stirring continued at rt until **86** disappeared as monitored by TLC. The reaction mixture was extracted using ethyl acetate and ice water. All the volatiles were removed under reduced pressure. The crude product was purified by silica gel chromatography using hexane/ethyl acetate as eluent, to afford **95**.

2-((2E,4E)-2-Methyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (86a).

This compound was prepared by following the general procedure 14 and isolated as pale yellow solid. $R_f = 0.5$ (Hexane/EtOAc = 3/1). IR (thin film, neat): $v_{max}/cm^{-1} v_{max}/cm^{-1} 3040$, 2926,

2854, 2743, 1700, 1645, 1612, 1390, 1287, 1241, 1012, 749. ¹H-NMR (400 MHz, CDCl₃): δ 10.01 (s, 1H), 8.01 (dd, J = 7.6 and 1.6 Hz, 1H), 7.70-7.65 (m, 2H), 7.47-7.43 (m, 3H), 7.39-7.32 (m, 3H), 7.18 (dd, J =

15.3 and 11.5 Hz, 1H), 6.73 (d, J = 15.3 Hz, 1H), 6.71 (d, J = 11.4 Hz, 1H), 2.24 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 198.5, 190.6, 144.3, 142.4, 141.0, 137.6, 136.1, 134.7, 133.4, 130.1, 129.8, 129.2, 128.8(2C), 128.3, 127.3(2C), 123.9, 11.9. HRMS (ESI): m/z calcd for $C_{19}H_{17}O_2$ (M+H)⁺: 277.1229. Found: 277.1221.

2-Cinnamyl-3-hydroxy-2-methyl-2,3-dihydro-1*H*-inden-1-one (95a).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86a** afforded 34 mg of **95a** (85% yield). $R_f = 0.2$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3427, 2927, 1705, 1605, 1062. ¹H-NMR (**400 MHz, CDCl₃**): δ 7.76 (d, J = 7.6 Hz, 1H), 7.71-7.67 (m, 2H), 7.51-7.47 (m, 1H), 7.31 (t, J = 7.2 Hz, 1H), 7.25-7.21 (m, 2H), 7.19-7.15 (m, 2H), 6.44 (d, J = 15.9 Hz, 1H), 6.09 (td, J = 15.9 and 11.5 Hz, 1H), 5.01 (s, 1H), 2.75-2.54 (m, 2H), 2.39 (s, 1H), 1.31 (s, 3H). ¹³C-NMR (**100 MHz, CDCl₃**): δ 207.5, 153.0, 137.0, 135.4, 134.9, 133.0, 129.5, 128.4(2C), 127.2, 126.4, 126.1(2C), 125.5, 123.6, 78.5, 54.6, 37.8, 21.5. HRMS (ESI): m/z calcd for $C_{19}H_{19}O_2$ (M+H)⁺: 279.1385. Found: 279.1394.

2-((2E,4E)-2-Benzyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (86b).

This compound was prepared by following the general procedure **14** and isolated as white solid. M.P = 135-137 °C. $R_f = 0.5$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3029, 2849, 1701, 1643, 1609, 1492, 1449,

1372, 1287, 1241, 746. ¹H-NMR (400 MHz, CDCl₃): δ 9.92 (s, 1H), 7.99 (d, J = 6.8 Hz, 1H), 7.66-7.59 (m, 2H), 7.41-30 (m, 11H), 7.25 (dd, J = 16.2 and 11.2 Hz, 1H), 6.87 (d, J = 16.4 Hz, 1H), 6.78 (d, J = 16.4 Hz, 1H), 4.08 (s, 2H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.6, 190.5, 145.7, 142.5, 142.3, 140.2, 139.5, 135.9, 134.9, 133.3, 129.9, 129.6, 129.5, 128.9(2C), 128.6(2C), 128.4(2C), 128.3, 127.4(2C), 126.2, 123.7, 31.7. HRMS (ESI): m/z calcd for C₂₅H₂₁O₂ (M+H)⁺: 353.1542. Found: 353.1558.

2-Benzyl-2-cinnamyl-3-hydroxy-2,3-dihydro-1*H*-inden-1-one (95b).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86b** afforded 33 mg of **95b** (83% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3435, 3029, 2918, 1701, 1604, 1453, 1069, 701. ¹H-NMR (**400 MHz, CDCl**₃): δ 7.72 (d, J = 7.5 Hz, 1H), 7.63-7.60 (m, 2H), 7.45-7.38 (m, 1H), 7.32-7.30 (m, 1H), 7.25-7.07 (m, 9H), 6.38 (d, J = 15.8 Hz, 1H), 5.96 (td, J = 15.8 and 7.5 Hz, 1H), 5.27 (d, J = 6.2 Hz, 1H), 3.24 (d, $J_{AB} = 13.8$ Hz, 1H), 2.70-2.64 (m, 1H), 2.59-2.53 (m, 1H), 2.23 (d, J = 7.1 Hz, 1H). ¹³C-NMR (**100 MHz, CDCl**₃): δ 206.3, 153.5, 137.5, 137.0, 135.3, 135.2, 132.9, 130.2(2C), 129.2, 128.8, 128.5(2C), 128.4(2C), 127.2, 126.7, 126.1(2C), 124.9, 123.3, 74.3, 59.9, 40.1, 38.1. HRMS (**ESI**): m/z calcd for C₂₅H₂₁O (M-OH)⁺: 337.1592. Found: 337.1609.

2-((2E,4E)-2,5-Diphenylpenta-2,4-dienoyl)benzaldehyde (86c).

This compound was prepared by following the general procedure **14** and isolated as Pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3058, 2848, 2745, 1779, 1699, 1647, 1607, 1492, 1448,

1279, 1239, 1068, 753. ¹H-NMR (400 MHz, CDCl₃): δ 10.09 (s, 1H), 7.97 (d, J = 7.2 Hz, 1H), 7.68-7.61 (m, 2H), 7.53-7.40 (m, 6H), 7.28-7.24 (m, 5H), 6.98-6.78 (m, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.1, 190.7, 144.4, 142.3, 142.1, 141.7, 135.9, 134.8, 134.7, 133.5, 130.7, 130.5(2C), 130.0, 129.3, 128.8(2C), 128.5, 128.3(2C), 128.1, 127.4(2C), 124.9. HRMS (ESI): m/z calcd for C₂₄H₁₉O₂ (M+H)⁺: 339.1385. Found: 339.1402.

2-Cinnamyl-3-hydroxy-2-phenyl-2,3-dihydro-1*H*-inden-1-one (95c).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86c** afforded 32.4 mg of **95c** (81% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3444, 3055, 3028,

1702, 1604, 1494, 1222, 1068, 754. ¹H-NMR (400 MHz, CDCl₃): δ 7.80 (d, J = 7.6 Hz, 1H), 7.70-7.69 (m, 2H), 7.52-7.45 (m, 2H), 7.35-7.12 (m, 8H), 7.05-7.03 (m, 1H), 6.37 (d, J = 16.3 Hz, 1H), 5.95 (dd, J = 16.0 and 7.8 Hz, 1H), 5.49 (s, 1H), 3.11-2.99 (m, 2H), 2.83 (brs, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 205.0, 52.9, 141.4, 137.0, 135.6(2C), 135.4, 132.9(2C), 129.6,

128.7(2C), 128.3(2C), 127.3, 128.4, 127.1(2C), 127.0, 126.1(2C), 125.2, 123.8, 79.4, 62.2, 37.9. **HRMS (ESI):** m/z calcd for C₂₄H₂₁O₂ (M+H)⁺: 341.1542. Found: 341.1531.

2-((2E,4E)-5-(4-Methoxyphenyl)-2-methylpenta-2,4-dienoyl)benzaldehyde (86d).

This compound was prepared by following the general procedure 14 and isolated as Pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 2932, 2840, 2749, 1700, 1639,

1593, 1510, 1253, 1016, 749. ¹**H-NMR (400 MHz, CDCl₃):** δ 9.98 (s, 1H), 7.89 (dd, *J* = 7.6 and 1.2 Hz, 1H), 7.66-7.60 (m, 2H), 7.40 (dd, *J* = 7.6 and 1.2 Hz, 1H), 7.39 (d, *J* = 8.6 Hz, 2H), 7.01 (dd, *J* = 15.4 and 11.3 Hz, 1H), 6.86 (d, *J* = 8.6 Hz, 2H), 6.69 (d, *J* = 11.3 Hz, 1H), 6.66 (d, *J* = 15.2 Hz, 1H), 3.89 (s, 3H), 2.19 (s, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 198.3, 190.6, 160.6, 145.3, 142.7, 141.0, 136.3, 134.7, 133.4, 129.8, 129.7, 128.9, 128.8(2C), 128.3, 121.8, 114.3(2C), 55.3, 11.8. **HRMS (ESI):** *m*/*z* calcd for C₂₀H₁₉O₃ (M+H)⁺: 307.1334. Found: 307.1322.

3-Hydroxy-2-((*E*)-3-(4-methoxyphenyl)allyl)-2-methyl-2,3-dihydro-1*H*-inden-1-one (95d).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86d** afforded 31 mg of **95d** (78% yield). $R_f = 0.2$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3441, 3057, 3029, 2917, 1706, 1604, 1495, 1222, 1067, 743. ¹H-NMR (**400**

MHz, CDCl₃): δ 7.78-7.76 (m, 1H), 7.70-7.68 (m, 2H), 7.51-7.47 (m, 1H), 7.23-7.18 (m, 1H), 7.11 (d, *J* = 8.7 Hz, 1H), 6.86-6.81 (m, 1H), 6.78 (d, *J* = 8.8 Hz, 1H), 6.39 (d, *J* = 15.9 Hz, 1H), 5.91 (td, *J* = 15.8 and 7.4 Hz, 1H), 5.01 (s, 1H), 3.77 (s, 3H), 2.62-2.51 (m, 2H), 2.40 (brs, 1H), 1.31 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 207.5, 158.9, 153.1, 135.4, 132.4, 130.1, 129.8, 129.5, 127.2(2C), 125.5, 124.2, 123.6, 113.8(2C), 78.6, 52.2, 54.5, 37.9, 21.6. HRMS (ESI): *m/z* calcd for C₂₀H₁₉O₃ (M-H)⁺: 307.1334. Found: 307.1323.

2-((2E,4E)-2-Methyl-5-(naphthalen-1-yl)penta-2,4-dienoyl)benzaldehyde (86e).

This compound was prepared by following the general procedure 14 and isolated as white solid. M.P = 174-176 $^{\circ}$ C. R_f = 0.3 (Hexane/EtOAc
= 4/1). IR (thin film, neat): $v_{max}/cm^{-1} 3054$, 2933, 2337, 1699, 1643, 1606, 1391, 1292, 1266, 1011, 772. ¹H-NMR (400 MHz, CDCl₃): δ 10.02 (s, 1H), 8.04-8.01 (m, 2H), 7.86-7.82 (m, 2H), 7.77 (d, J = 7.2 Hz, 1H), 7.72-7.65 (m, 2H), 7.53-7.45 (m, 5H), 7.25 (dd, J = 15.3 and 11.3 Hz, 1H), 6.83 (d, J = 11.3 Hz, 1H), 2.25 (d, J = 0.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 198.6, 190.6, 144.2, 142.5, 137.8, 137.6, 134.8, 133.7, 133.5, 133.4, 131.1, 130.2, 129.8, 129.6, 128.8, 128.4, 126.6, 126.5, 126.1, 125.5, 124.3, 123.2, 12.0. HRMS (ESI): m/z calcd for C₂₃H₁₉O₂ (M+H)⁺: 327.1385. Found: 327.1397.

3-Hydroxy-2-methyl-2-((*E*)-3-(naphthalen-1-yl)allyl)-2,3-dihydro-1*H*-inden-1-one (95e).

This compound was isolated as pale yellow oil. Following the general procedure 16, 40 mg of 86e afforded 34.8 mg of 95e (87% yield). $R_f =$ 0.3 (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3424, 2962, 2926, 1702, 1606, 1059, 777. ¹H-NMR (400 MHz, CDCl₃): δ 7.97-7.95

(m, 1H), 7.85-7.62 (m, 5H), 7.48-7.43 (m, 3H), 7.33-7.18 (m, 2H), 7.12 (d, J = 15.6 Hz, 1H), 6.09 (td, J = 15.6 and 7.5 Hz, 1H), 5.03 (s, 1H), 2.74-2.44 (m, 2H), 1.67 (s, 1H), 1.35 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 207.1, 153.1, 135.4, 135.1, 135.0, 133.5, 130.9, 130.4, 129.8, 129.5, 128.4, 127.6, 126.0, 125.7, 125.6, 125.5, 123.9, 13.8, 123.6, 78.5, 54.9, 38.3, 21.5. HRMS (ESI): m/z calcd for C₂₃H₂₁O₂ (M+H)⁺: 329.1542. Found: 329.1534.

5-Fluoro-2-((2E,4E)-2-methyl-5-phenylpenta-2,4-dienovl)benzaldehyde (86f).

This compound was prepared by following the general procedure 14 and isolated as Pale yellow solid. M.P = 88-90 $^{\circ}$ C. R_f = 0.5 (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3031, 2864, 2754, 1701, 1648, 1612, 1580, 1456, 1252, 1155, 999, 793. ¹H-NMR (400 MHz, CDCl₃): δ 9.95 (d, J = 2.2 Hz, 1H), 7.68 (dd, J = 8.6 and 2.6 Hz, 1H), 7.48-7.44 (m, 3H), 7.37-7.31 (m, 4H), 7.15 (dd, J = 15.4and 11.2 Hz, 1H), 6.76 (d, J = 15.4 Hz, 1H), 6.72 (d, J = 11.2 Hz, 1H), 2.21 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.0, 189.1, 163.3 (d, J = 251 Hz, 1C), 145.0, 141.6, 138.7 (d, J = 3.5Hz, 1C), 137.5, 137.3 (d, J = 64.0 Hz, 1C), 135.9, 130.9 (d, J = 7.8 Hz, 1C), 129.4, 128.9(2C), 127.(2c), 123.8, 120.3 (d, J = 21.8 Hz, 1C), 115.7 (d, J = 22.4 Hz, 1C), 12.0. ¹⁹F-NMR (374) **MHz.** CDCl₃): δ -108.8. **HRMS** (ESI): m/z calcd for C₁₉H₁₆FO₂ (M+H)⁺: 295.1134. Found: 295.1100.

2-Cinnamyl-5-fluoro-3-hydroxy-2-methyl-2,3-dihydro-1*H*-inden-1-one (95f).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 50 mg of **86f** afforded 38.4 mg of **95f** (77% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3434, 3029, 2967, 2928, 1702, 1607, 1254, 1055, 744. ¹H-NMR (400 MHz, CDCl₃): δ 7.77 (dd, J = 8.4 and 5.1 H, 1H), 7.36-7.28 (m, 2H), 7.25-7.13 (m, 5H), 6.42 (d, J = 15.8 Hz, 1H), 6.07 (td, J = 15.8 and 7.5 Hz, 1H), 4.98 (s, 1H), 2.81 (s, 1H), 2.76-2.50 (m, 2H), 1.30 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 205.7, 167.6 (d, J = 255.9 Hz, 1C), 156.1 (d, J = 9.2 Hz, 1C), 137.0, 133.1, 131.2 (d, J = 1.6 Hz, 1C), 128.8, 128.4(2C), 127.3, 126.1(2C), 126.0, 117.7 (d, J = 23.5 Hz, 1C), 112.4 (d, J = 22.5 Hz, 1C), 78.0 (d, J = 1.7 Hz, 1C), 55.1, 37.9, 21.3. ¹⁹F-NMR (374 MHz, CDCl₃): δ -

5-Methoxy-2-((2E,4E)-2-methyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (86g).

101.0. **HRMS (ESI):** *m/z* calcd for C₁₉H₁₆FO (M-OH)⁺: 279.1185. Found: 279.1170.

This compound was prepared by following the general procedure 14 and isolated as Pale yellow oil. $R_f = 0.3$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3039, 2938, 2846, 1697, 1606, 1491,

1448, 1361, 1281, 1009, 748. ¹H-NMR (400 MHz, CDCl₃): δ 9.98 (s, 1H), 7.49 (d, J = 2.6 Hz, 1H), 7.46-7.41 (m, 3H), 7.37-7.30 (m, 3H), 7.19-7.13 (m, 2H), 6.78 (d, J = 11. Hz, 1H), 6.75 (d, J = 15.2 Hz, 1H), 3.92 (s, 3H), 2.20 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.7, 190.5, 160.9, 144.3, 140.9, 137.8, 137.1, 136.1, 135.1, 130.7, 129.2, 128.8(2C), 127.3(2C), 123.9, 119.5, 112.5, 55.7, 12.2. HRMS (ESI): m/z calcd for C₂₀H₁₉O₃ (M+H)⁺: 307.1334. Found: 307.1322.

2-Cinnamyl-3-hydroxy-5-methoxy-2-methyl-2,3-dihydro-1*H*-inden-1-one (95g).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86g** afforded 34.4 mg of **95g** (86% yield). $R_f = 0.2$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3409, 2963,

2929, 1690, 1600, 1490, 1260, 1060. ¹H-NMR (400 MHz, CDCl₃): δ 7.70 (d, J = 4.5 Hz, 1H), 7.32-7.15 (m, 5H), 7.12-7.10 (m, 1H), 7.01-6.97 (m, 1H), 6.43 (d, J = 15.9 Hz, 1H), 6.11 (td, J = 15.8 and 7.5 Hz, 1H), 4.94 (s, 1H), 3.88 (s, 3H), 2.73-2.70 (m, 1H), 2.63-2.51 (m, 1H), 1.76 (s, 1H), 1.29 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 205.6, 165.9, 156.1, 137.1, 132.8, 128.8,

128.4(2C), 127.2, 126.7, 126.1(2C), 125.4, 117.6, 78.6, 55.7, 54.6, 38.0, 21.7. **HRMS (ESI):** m/z calcd for C₂₀H₂₁O₃ (M+H)⁺: 309.1491. Found: 309.1478.

4,5-Dimethoxy-2-((2E,4E)-2-methyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (86h).

This compound was prepared by following the general procedure **14** and isolated as Pale yellow oil. $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 2932, 2851, 1770, 1774, 1685, 1640,

1461, 1249, 738. ¹H-NMR (400 MHz, CDCl₃): δ 9.86 (s, 1H), 7.50 (s, 1H), 7.45 (dd, J = 7.5and 1.0 Hz, 1H), 7.37-7.30 (m, 4H), 7.17 (dd, J = 15.3 and 11.2 Hz, 1H), 6.89 (s, 1H), 6.76 (d, J = 11.3 Hz, 1H), 6.75 (d, J = 15.4 Hz, 1h), 4.00 (s, 3H), 3.96 (s, 3H), 2.20 (d, J = 1.0 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.7, 189.0, 153.1, 150.1, 144.9, 141.4, 137.9, 137.7, 136.0, 129.3, 128.8(2C), 128.5, 127.3(2C), 123.9, 110.7, 109.6, 56.4, 56.2, 12.0. HRMS (ESI): m/zcalcd for C₂₁H₂₁O₄ (M+H)⁺: 337.1440. Found: 337.1425.

2-Cinnamyl-3-hydroxy-5,6-dimethoxy-2-methyl-2,3-dihydro-1*H*-inden-1-one (95h).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86h** afforded 33 mg of **95h** (83% yield). $R_f = 0.3$ (Hexane/EtOAc = 2/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3417, 3020, 2962, 1694, 1596, 1500, 1289, 1011, 742. ¹H-NMR (400 MHz, CDCl₃): δ 7.32-7.18 (m, 5H), 7.17 (s, 1H), 7.11 (s, 1H), 6.45 (d, *J* = 15.9 Hz, 1H), 6.14 (td, *J* = 15.8 and 7.3 Hz, 1H), 4.92 (s, 1H), 3.97 (s, 3H), 3.90 (s, 3H), 2.75-2.52 (m, 2H), 1.64 (brs, 1H), 1.28 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 206.2, 156.0, 150.9, 148.3, 137.1, 132.9, 128.8, 128.4(2C), 127.2, 126.7, 126.1(2C), 106.5, 103.8, 78.5, 56.3, 56.2, 54.2, 38.2, 21.9. HRMS (ESI): *m*/*z* calcd for C₂₁H₂₃O₄ (M+H)⁺: 339.1596. Found: 339.1580.

2-((2E,4E)-2-Benzyl-5-phenylpenta-2,4-dienoyl)-4,5-dimethoxybenzaldehyde (86i).

This compound was prepared by following the general procedure **14** and isolated as Pale yellow oil. $R_f = 0.2$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3060, 3026, 2937, 2851, 1768, 1687,

1590, 1459, 1348, 1282, 1079, 738. ¹**H-NMR (400 MHz, CDCl₃):** δ 9.76 (s, 1H), 7.49 (s, 1H), 7.43 (dd, J = 7.6 and 1.2 Hz, 2H), 7.36-7.25 (m, 7H), 7.24-7.20 (m, 2H), 6.92 (d, J = 11.3 Hz,

1H), 6.80 (d, J = 15.3 Hz, 1H), 6.80 (s, 1H), 4.06 (s, 2H), 3.99 (s, 3H), 3.91 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.0, 189.0, 153.0, 150.2, 145.7, 142.5, 140.8, 139.3, 137.7, 135.8, 129.6, 128.9(2C), 128.7(2C), 128.6, 128.4(2C), 127.4(2C), 126.3, 123.6, 110.6, 109.3, 56.4, 56.2, 32.0. HRMS (ESI): m/z calcd for C₂₇H₂₅O₄ (M+H)⁺: 413.1753. Found: 413.1736.

2-Benzyl-2-cinnamyl-3-hydroxy-5,6-dimethoxy-2,3-dihydro-1*H*-inden-1-one (95i).

3,5-Dimethoxy-2-((2E,4E)-2-methyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (86j).

This compound was prepared by following the general procedure **14** and isolated as Pale yellow solid. M.P = 114-116 °C. $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 2941, 2843,

1699, 1645, 1605, 1457, 1389, 1289, 1008, 748. ¹**H-NMR (400 MHz, CDCl₃):** δ 9.81 (s, 1H), 7.44-7.42 (m, 2H), 7.35-7.28 (m, 3H), 7.6 (dd, *J* = 15.3 and 11.2 Hz, 1H), 7.05 (d, *J* = 2.3 Hz, 1H), 6.75-6.69 (m, 2H), 6.74 (d, *J* = 2.2 Hz, 1H), 3.90 (s, 3H), 3.78 (s, 3H), 2.18 (d, *J* = 0.9 Hz, 3H). ¹³**C-NMR (100 MHz, CDCl₃):** δ 197.1, 190.1, 161.3, 158.2, 143.1, 140.5, 138.6, 136.2, 135.9, 129.1, 128.8(2C), 127.2(2C), 125.6, 124.3, 104.6, 103.7, 56.2, 55.8, 11.5. **HRMS (ESI):** *m/z* calcd for C₂₁H₂₁O₄ (M+H)⁺: 337.1440. Found: 337.1430.

2-Cinnamyl-3-hydroxy-5,7-dimethoxy-2-methyl-2,3-dihydro-1H-inden-1-one (95j).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86j** afforded 32 mg of **95j** (82% yield). $R_f = 0.3$ (Hexane/EtOAc = 2/1). **IR (thin film, neat):**

 v_{max} /cm⁻¹ 3431, 2961, 1688, 1603, 1458, 1220, 1325, 1048. ¹H-NMR (400 MHz, CDCl₃): δ 7.31-7.27 (m, 1H), 7.24-7.15 (m, 4H), 6.73-6.71 (m, 1H), 6.45 (d, J = 15.5 Hz, 1H), 6.39-6.38 (m, 1H), 6.18 (td, J = 15.8 and 7.6 Hz, 1H), 4.86 (s, 1H), 3.89 (s, 3H), 3.87 (s, 3H), 2.72-2.50 (m,

2H), 1.64 (brs, 1H), 1.26 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 203.4, 167.5, 159.0, 158.2, 137.2, 132.7(2C), 128.4(2C), 128.2, 127.1, 126.1(2C), 116.8, 100.5, 99.3, 78.3, 55.9(2C), 54.6, 38.0, 21.9. HRMS (ESI): *m/z* calcd for C₂₁H₂₁O₃ (M-OH)⁺: 321.1491. Found: 321.1457.

1-((2E,4E)-2-Methyl-5-phenylpenta-2,4-dienoyl)-2-naphthaldehyde (86k).

This compound was prepared by following the general procedure **14** and isolated as white solid. $R_f = 0.5$ (Hexane/EtOAc = 3/1). **IR** (thin film, **neat**): v_{max}/cm^{-1} ¹ 3058, 2926, 2854, 2749, 1762, 1694, 1643, 1609, 1459, 1386, 1282, 1081, 745. ¹H-NMR (**400 MHz, CDCl₃**): δ 10.13 (s, 1H), 8.04 (s, 2H), 7.96 (d, J = 7.9 Hz, 1H), 7.78 (d, J = 8.4 Hz, 1H), 7.66 (t, J = 7.2 Hz, 1H), 7.57 (t, J = 7.2 Hz, 1H), 7.41-7.28 (m, 5H), 7.19 (dd, J = 15.2 and 11.2 Hz, 1H), 6.69 (d, J = 11.2 Hz, 1H), 6.59 (d, J = 15.2 Hz, 1H), 2.36 (s, 3H). ¹³C-NMR (**100 MHz, CDCl₃**): δ 199.5, 190.4, 145.3, 143.6, 141.8, 138.6, 136.0, 135.9, 130.7, 130.6, 129.5, 129.4, 129.3, 128.8(2C), 128.4, 127.8, 127.3(2C), 126.9, 123.8 123.5, 11.5. HRMS (**ESI**): m/z calcd for C₂₃H₁₇O₂ (M-H)⁺: 325.1229. Found: 325.1246.

2-Cinnamyl-3-hydroxy-2-methyl-2,3-dihydro-1*H*-cyclopenta[*a*]naphthalen-1-one (95k).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 40 mg of **86k** afforded 36 mg of **95k** (92% yield). $R_f = 0.3$ (Hexane/EtOAc = 2/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3430, 3055, 3026, 2965, 1704, 1605, 1461, 1293, 1061, 764. ¹H-NMR (400 MHz, CDCl₃): δ 9.12 (d, J = 8.1 Hz, 1H), 8.14 (d, J = 8.4 Hz, 1H), 7.92 (d, J = 8.1 Hz, 1H), 7.75-7.68 (m, 2H), 7.62-7.58 (m, 1H), 7.30-713 (m, 5H), 6.47 (d, J = 15.6 Hz, 1H), 6.18 (td, J = 15.8 and 7.8 Hz, 1H), 5.09 (s, 1H), 2.81-2.79 9m, 1H), 2.71-2.55 (m, 1H), 2.16 (s, 1H), 1.37 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 207.9, 155.1, 137.0, 136.6, 133.8, 133.1, 129.2, 128.83, 128.81, 128.4(2C), 128.3(2C), 127.3, 127.2, 126.6, 122.3, 78.5, 54.6, 38.1, 33.1, 21.8. HRMS (ESI): m/z calcd for C₂₃H₁₉O (M-OH)⁺: 311.1436. Found: 311.1428.

2-((2E,4E)-2-Methyl-5-phenylpenta-2,4-dienoyl)nicotinaldehyde (86m).

This compound was prepared by following the general procedure **14** and isolated as Pale yellow oil. $R_f = 0.3$ (Hexane/EtOAc = 2/1). **IR** (**thin film**, **neat**): v_{max}/cm^{-1} 3050, 2922, 2860, 1702, 1650, 1610, 1445, 1291, 1191,

1022, 970, 741. ¹H-NMR (400 MHz, CDCl₃): δ 10.07 (s, 1H), 8.85 (dd, J = 7.2 and 2.3 Hz, 1H), 8.34 (dd, J = 8.0 and 1.6 Hz, 1H), 7.58 (dd, J = 8.0 and 4.8 Hz, 1H), 7.48-7.45 (m, 2H), 7.37-7.32 (m, 3H), 7.21 (dd, J = 15.5 and 11.2 Hz, 1H), 6.89 (dd, J = 11.2 and 0.8 Hz, 1H), 6.79 (d, J = 15.5 Hz, 1H), 2.24 (d, J = 0.8 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 195.1, 189.4, 160.0, 152.6, 146.4, 142.0, 136.6, 136.0, 135.8, 130.8, 129.4, 128.9(2C), 127.4(2C), 124.6, 123.9, 11.8. HRMS (ESI): m/z calcd for C₁₈H₁₈NO₂ (M+H)⁺: 280.1338. Found: 280.1325.

6-Cinnamyl-5-hydroxy-6-methyl-5*H*-cyclopenta[*b*]pyridin-7(6*H*)-one (95m).

This compound was isolated as white solid. Following the general procedure **16**, 30 mg of **86m** afforded 26 mg of **95m** (87% yield). M.P = 197-199 °C. R_f = 0.2 (Hexane/EtOAc = 1/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3420, 2964, 1721, 1463, 1299, 1025, 763. ¹H-NMR (**400 MHz, (CD₃)₂SO):** δ 8.77-8.76 (m, 1H), 8.20-8.18 (m, 1H), 7.68 (dd, *J* = 7.8 and 4.6 Hz, 1H), 7.28-7.24 (m, 2H), 7.19-7.17 (m, 3H), 6.29 (d, *J* = 15.9 Hz, 1H), 6.22 (d, *J* = 6.0 Hz, 1H), 6.10 (td, *J* = 15.9 and 7.8 Hz, 1H), 4.97 (d, *J* = 6.0 Hz, 1H), 2.45-2.39 (m, 1H), 2.34-2.29 (m, 1H), 1.22 (s, 3H). ¹³C-NMR (**100 MHz, (CD₃)₂SO):** δ 207.1, 152.2, 152.1, 150.0, 137.5, 134.8, 132.2, 128.9(2C), 128.7, 127.5, 126.9, 126.2(2C), 74.4, 54.8, 38.0, 20.6. HRMS (**ESI**): *m/z* calcd for C₁₈H₁₈NO₂ (M+H)⁺: 280.1338. Found: 280.1337.

2-((2E,4E)-2-Methyl-5-phenylpenta-2,4-dienoyl)benzo[b]thiophene-3-carbaldehyde (86l).

This compound was prepared by following the general procedure **15** and isolated as Pale yellow oil. $R_f = 0.5$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3058, 2927, 2849, 1678, 1606, 1503, 1458, 1281.

1222, 1076, 756. ¹H-NMR (400 MHz, CDCl₃): δ 10.17 (s, 1H), 8.78 (dd, J = 7.2 and 1.2 Hz, 1H), 7.90-7.88 (m, 1H), 7.59-7.46 (m, 4H), 7.38-7.33 (m, 3H), 7.21-7.18 (m, 2H), 6.90-6.85 (m, 1H), 2.24 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 190.5, 185.5, 153.7, 146.6, 142.8, 139.1, 137.8, 135.9, 135.8, 134.7, 129.7, 128.9(2C), 127.5(2C), 127.1, 126.7, 125.9, 123.5, 122.0, 12.3. HRMS (ESI): m/z calcd for C₂₁H₁₇O₂S (M+H)⁺: 333.0949. Found: 333.0935.

2-Cinnamyl-1-hydroxy-2-methyl-1*H*-benzo[*b*]cyclopenta[*d*]thiophen-3(2*H*)-one (95l).

This compound was isolated as pale yellow oil. Following the general procedure **16**, 35 mg of **86l** afforded 28 mg of **95l** (80% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3425, 3026, 2925, 1689, 1595, 1426, 1268, 1084, 745. ¹H-NMR (400 MHz, CDCl₃): δ 8.11-

8.08 (m, 1H), 7.93-7.91 (m, 1H), 7.54-7.46 (m, 2H), 7.35-7.17 (m, 5H), 6.53 (d, J = 15.8 Hz, 1H), 6.24 (td, J = 15.8 and 7.0 Hz, 1H), 5.22 (d, J = 8.4 Hz, 1H), 2.95-2.67 (m, 2H), 2.50 (d, J = 8.8 Hz, 1H), 1.39 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 199.8, 161.4, 148.7, 140.6, 136, 133.5, 131.8, 128.5(2C), 128.4, 128.3(2C), 127.4, 126.3, 125.4, 124.7, 124.4, 76.4, 58.7, 38.2, 22.6. HRMS (ESI): m/z calcd for C₂₁H₁₉O₂S (M+H)⁺: 335.1106. Found: 335.1089.

2-((2E,4E)-2,4-Dimethyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (86n).

This compound was prepared by following the general procedure 14 and isolated as Pale yellow oil. $R_f = 0.6$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3035, 2931, 1706, 1458, 1285, 1075, 702. ¹H-NMR (400

MHz, CDCl₃): δ 10.01 (s, 1H), 7.98 (dd, J = 7.3 and 1.2 Hz, 1H), 7.67-7.61 (m, 2H), 7.44 (dd, J = 7.4 and 1.4 Hz, 1H), 7.37-7.33 (m, 2H), 7.29-7.26 (m, 3H), 6.62 (s, 1H), 6.55 (s, 1H), 2.28 (d, J = 1.2 Hz, 3H), 2.10 (d, J = 1.2 Hz, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 199.6, 190.6, 149.6, 142.6, 137.2, 136.7, 136.6, 134.7, 134.2, 133.4, 130.3, 129.8, 129.3(2C), 128, 128.3(2C), 127.5, 18.2, 13.3. HRMS (ESI): m/z calcd for C₂₀H₁₇O₂ (M-H)⁺: 289.1229. Found: 289.1224.

(E)-2-(2-Methyl-5,5-diphenylpenta-2,4-dienoyl)benzaldehyde (860).

This compound was prepared by following the general procedure **14** and isolated as Pale yellow oil. $R_f = 0.4$ (Hexane/EtOAc = 4/1). **IR** (thin film, neat): v_{max}/cm^{-1} 3379, 3058, 1695, 1651, 1578, 1445, 1291, 1022, 761. ¹H-

NMR (400 MHz, CDCl₃): δ 9.94 (s, 1H), 7.83 (d, *J* = 7.3 Hz, 1H), 7.53-7.46 (m, 2H), 7.34-7.20 (m, 9H), 7.05-6.99 (m, 3H), 6.63 (d, *J* = 11.5 Hz, 1H), 2.24 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 198.8, 190.5, 151.7, 143.0, 142.5, 141.2, 138.4, 137.8, 134.3, 133.2, 130.3(2C), 129.7, 129.3, 128.9, 128.4(2C), 128.3(2C), 128.1, 128.0, 127.9(2C), 122.9, 11.6. HRMS (ESI): *m/z* calcd for C₂₅H₂₁O₂ (M+H)⁺: 353.1542. Found: 353.1524.

General procedure 17: Synthesis of *E*,*Z*-86a

Step I: An oven dried 25 mL RB flask was charged with sodium hydride (60% oil dispersion, 5.2 mmol), 10 mL dry THF and placed at 0 °C. To this suspension, triethyl 2-phosphonopropionate 107 (5.1 mmol) was added drop wise under argon atmosphere at same temperature and stirred until the effervescence of hydrogen gas ceased. Phenyl propiolaldehyde 72 (5.0 mmol) dissolved in 1 mL of dry THF was added dropwise over 2 min and continued stirring for 30 min. The reaction mixture was quenched with saturated aq. NH₄Cl solution and extracted using ethyl acetate. The organic extracts were combined dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford 108 as colorless oil.

Step II: An oven dried 50 mL RB flask was charged with **108** (4.0 mmol), 10 mL dry THF and placed at 0 °C. To the reaction mixture DIBAL-H (8.2 mmol) was added drop wise at the same temperature and allowed to stir at rt for 5 h. The reaction mixture was quenched with saturated aq. NH₄Cl solution and the resultant mixture was filtered through Buchner funnel, the filtrate was extracted using ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated to afford the crude alcohol as pale yellow oil. The crude alcohol was further subjected to IBX oxidation to afford the aldehyde **109** as a pale yellow solid.

Step III: Alcohol 110 was synthesized by following the general procedure 12, Step IV.

Step IV: The IBX oxidation of alcohol **110** and subsequent *p*-TSA mediated acetal deprotection (as described in general procedure **12**, Step IV) afforded the ynenone-aldehyde **111**.

Step V: In an oven dried 10 mL RB flask the enynone **111** (1 mmol) was dissolved in 1 mL dry methanol. Quinoline (0.15 mmol) and Lindlar's catalyst (0.1 mmol) were introduced to the reaction mixture. The reaction mixture was evacuated and refilled with hydrogen gas (3 times) and stirred at room temperature. The reaction mixture was followed carefully to avoid over-reduction. After completion of the reaction (by TLC), the reaction mixture was filtered through a celite pad and the filtrate was extracted using ethyl acetate. The organic extracts were combined, dried over anhydrous sodium sulphate and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent to afford E,Z-86a as pale yellow oil.

(E)-2-(2-Methyl-5-phenylpent-2-en-4-ynoyl)benzaldehyde (111).

This compound was isolated as pale yellow oil. Following the general procedure 17, 150 mg of 110 afforded 93 mg of 111 (62% yield over two steps). $R_f = 0.5$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1}

3067, 2927, 2196, 1700, 1657, 1598, 1253, 1004. ¹H-NMR (400 MHz, CDCl₃): δ 9.98 (s, 1H), 7.95 (dd, J = 7.3 and 1.4 Hz, 1H), 7.69-7.62 (m, 2H), 7.46-7.40 (m, 3H), 7.37-7.31 (m, 3H), 6.16 (s, 1H), 2.31 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 197.9, 190.9, 148.0, 140.9, 134.8, 133.6, 131.7(2C), 131.2, 130.1, 129.3, 128.5(2C), 128.3, 124.0, 122.3, 105.4, 85.8, 14.5. HRMS (ESI): m/z calcd for C₁₉H₁₅O₂ (M+H)⁺: 275.1072. Found: 275.1060.

2-((2E,4Z)-2-Methyl-5-phenylpenta-2,4-dienoyl)benzaldehyde (E,Z-86a).

This compound was isolated as pale yellow oil. Following the general procedure 17 (step-IV), 80 mg of 111 afforded 66 mg of E,Z-86a (83% yield). $R_f = 0.5$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm^{-1} 3040, 2926, 2743, 1705, 1642, 1612, 1390, 1012, 749. ¹H-NMR (400 MHz, CDCl₃): δ 9.97 (s, 1H), 7.91 (d, J = 7.6 Hz, 1H), 7.61 (t, J = 7.3 Hz, 1H), 7.54 (t, J = 7.4 Hz, 1H), 7.37 (d, J = 7.2 Hz, 1H), 7.18-7.15 (m, 3H), 6.99 (d, J = 11.3 Hz, 1H), 6.85 (d, J = 11.4 Hz, 1H), 6.63 (dd, J = 11.4 and 11.3 Hz, 1H), 2.18 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 199.0, 190.5, 142.4, 140.5, 139.1, 138.1, 136.0, 134.5, 133.4, 130.2, 129.6, 129.2(2C), 128.1(2C), 128.0, 127.3, 124.9, 11.6.

General Procedure 18: Reductive addol reaction of 86a in the presence of D₂O

An oven dried 5 mL glass vial was charged with 86a (30 mg, 0.11 mmol). DMF (1 mL), D₂O (3.3 mmol) and PBu₃ (1.3 mmol) were introduced at room temperature (rt) and stirring continued at rt until **86a** disappeared as monitored by TLC. The reaction mixture was extracted using ethyl acetate. All the volatiles were removed under reduced pressure. The crude product was directly purified by silica gel chromatography using hexane/ethyl acetate as eluent, to afford 95a.

2-Cinnamyl-3-hydroxy-2-methyl-2,3-dihydro-1*H*-inden-1-one (95a-D).

This compound was isolated as pale yellow oil. Following the general procedure 18, 50 mg of 86a afforded 41 mg of 95a-D (80% yield). $R_f = 0.2$ (Hexane/EtOAc = 3/1). IR (thin film, neat): v_{max}/cm⁻¹ 3424, 2926, 1703, 1605, 1461, 1293, 1061. ¹H-NMR (400 MHz, CDCl₃): δ 7.75 (d, J

General Procedure 19: Reductive aldol reaction of 86a in the presence of ¹⁸O-labelled water An oven dried 5 mL glass vial was charged with 86a (30 mg, 0.11 mmol). DMF (1 mL), H₂¹⁸O (3.3 mmol) and PBu₃ (1.3 mmol) were introduced at room temperature (rt) and stirring continued at rt until 86a disappeared as monitored by TLC. The crude reaction mixture was directly subjected to the HRMS analysis.

General procedure 20: Synthesis of fused γ -lactones

An oven dried 5 mL glass vial was charged with 95 (0.15 mmol) in 1.0 mL dimethylformamide. oxone (0.75 mmol) was added in one portion followed by the addition of 10 mol% OsO₄ (0.1 M solution in DMF) and stirring continued at rt until 95 disappeared as monitored by TLC. The reaction mixture was diluted with brine and extracted using ethyl acetate. All the volatiles were removed under reduced pressure. The crude product was purified by silica gel chromatography using hexane/ethyl acetate as eluent to afford 113.

3a-Methyl-3,3a-dihydro-2H-indeno[1,2-b]furan-2,4(8bH)-dione (113a).

This compound was isolated as white solid. Following the general procedure 20, 50 mg of **95a** afforded 25 mg of **113a** (71% yield). M.P = 116-117 °C. $R_f = 0.2$ (Hexane/EtOAc = 2/1). **IR** (thin film, neat): v_{max}/cm^{-1} 2931, 1782, 1723, 1605, 1463, 1379, 1293, 1175, 1019, 748. ¹H-NMR (400 MHz, CDCl₃): δ 7.85 (d, J = 7.9 Hz, 1H), 7.81-7.75 (m, 2H), 7.64-7.60 (m, 1H), 5.58 (s, 1H), 2.87 (d, $J_{AB} = 18.9$ Hz, 1H), 2.67 (d, J_{AB} = 18. 18.9 Hz, 1H), 1.53 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 204.2, 174.5, 148.2, 136.3, 135.1, 131.2, 127.5, 124.8, 85.5, 51.3, 38.8, 21.0. **HRMS (ESI):** m/z calcd for C₁₂H₁₁O₃ (M+H)⁺: 203.0708. Found: 203.0699.

3a-Benzyl-3,3a-dihydro-2H-indeno[1,2-b]furan-2,4(8bH)-dione (113b).

This compound was isolated as white solid. Following the general procedure **20**, 40 mg of **95b** afforded 19 mg of **113b** (60% yield). M.P = 98-100 °C. $R_f = 0.3$ (Hexane/EtOAc = 2/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3033, 2927, 2855, 1783,

1720, 1170, 1011, 704. ¹H-NMR (400 MHz, CDCl₃): δ 7.79 (d, J = 7.6 Hz, 1H), 7.71-7.63 (m, 2H), 7.55 (t, J = 8.0 Hz, 1H), 7.25-7.14 (m, 5H), 5.78 (s, 1H), 3.41 (d, J_{AB} = 13.8 Hz, 1H), 3.04 (d, J_{AB} = 13.8 Hz, 1H), 2.84 (d, J_{AB} = 19.0 Hz, 1H), 2.78 (d, J_{AB} = 19.0 Hz, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 203.8, 174.2, 148.4, 136.3, 135.7, 135.0, 131.0, 129.9(2C), 128.8(2C), 127.4, 127.3, 124.5, 82.1, 56.3, 39.7, 37.6. HRMS (ESI): m/z calcd for C₁₈H₁₅O₃ (M+H)⁺: 279.1021. Found: 279.1008.

7-Methoxy-3a-methyl-3,3a-dihydro-2H-indeno[1,2-b]furan-2,4(8bH)-dione (113c).

This compound was isolated as white solid. Following the general procedure **20**, 40 mg of 9**5g** afforded 20 mg of **113c** (67% yield). M.P = 113-114 °C. $R_f = 0.4$ (Hexane/EtOAc = 1/1). **IR (thin film, neat):** v_{max}/cm^{-1}

¹ 3056, 1781, 1712, 1600, 1263, 1019. ¹H-NMR (400 MHz, CDCl₃): δ 7.76 (d, *J* = 8.3 Hz, 1H), 7.13 (dt, *J* = 8.3 and 2.3 Hz, 2H), 5.50 (s, 1H), 3.93 (s, 3H), 2.85 (d, *J*_{AB} = 19.0 Hz, 1H), 2.64 (d, *J*_{AB} = 19.0 Hz, 1H), 1.52 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 202.3, 174.7, 166.4, 151.1, 127.9, 126.5, 119.5, 110.1, 85.4, 56.0, 51.5, 38.8, 21.1. HRMS (ESI): *m*/*z* calcd for C₁₃H₁₃O₄ (M+H)⁺: 233.0814. Found: 233.0808.

6,7-Dimethoxy-3*a*-methyl-3,3*a*-dihydro-2*H*-indeno[1,2-*b*]furan-2,4(8*bH*)-dione (113d).

This compound was isolated as white solid. Following the general procedure **20**, 50 mg of **95h** afforded 24 mg of **113d** (62% yield). M.P = 165-167 °C. $R_f = 0.3$ (Hexane/EtOAc = 1/1). **IR** (thin film, neat): v_{max}/cm^{-1}

3028, 2936, 2841, 1779, 1707, 1593, 1506, 1331, 1014. ¹H-NMR (400 MHz, CDCl₃): δ 7.20 (s, 1H), 7.13 (s, 1H), 5.49 (s, 1H), 4.02 (s, 3H), 3.95 (s, 3H), 2.85 (d, $J_{AB} = 19.1$ Hz, 1H), 2.64 (d, $J_{AB} = 191.1$ Hz, 1H), 1.52 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 198.8, 170.8, 152.6, 148.2, 139.5, 124.2, 103.9, 100.6, 81.6, 52.6, 52.4, 47.5, 35.0, 17.3. HRMS (ESI): m/z calcd for C₁₄H₁₅O₅ (M+H)⁺: 263.0919. Found: 263.0916.

9a-Methyl-9,9a-dihydro-6bH-benzo[4,5]indeno[1,2-b]furan-8,10-dione (113e).

This compound was isolated as white solid. Following the general procedure **20**, 50 mg of **95k** afforded 24 mg of **113e** (63% yield). M.P = 154-156 $^{\circ}$ C. R_f = 0.2 (Hexane/EtOAc = 2/1). IR (thin film, neat): v_{max}/cm^{-1} 3058, 1781, 1707, 1325, 1177, 1041. ¹**H-NMR (400 MHz, CDCl₃):** δ 9.12 (d, J = 8.3 Hz, 1H), 8.23 (d, J = 8.4 Hz, 1H), 7.97 (d, J = 8.1 Hz, 1H), 7.78-7.74 (m, 2H), 7.68 (t, J = 7.9 Hz, 1H), 5.66 (s, 1H), 2.95 (d, $J_{AB} = 19.0$ Hz, 1H), 2.72 (d, $J_{AB} = 19.0$ Hz, 1H), 1.61 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 204.7, 174.6, 150.4, 137.7, 134.3, 129.8, 129.0, 128.5, 128.2, 124.8, 123.2, 85.4, 51.4, 39.2, 21.3.

HRMS (ESI): m/z calcd for C₁₆H₁₃O₃ (M+H)⁺: 253.0865. Found: 253.0854.

General Procedure 21: Synthesis of indane fused-pyrans 114 and dibenzo azulenones 118

An oven dried 5 mL glass vial was charged with 95 (30 mg, 0.1 mmol) in an appropriate solvent (1.0 mL) and catalyst was introduced under nitrogen atmosphere and stirring continued at an appropriate temperature until 95 disappeared as monitored by TLC. The reaction mixture was quenched with saturated aq. NaHCO₃ and extracted using DCM. Volatiles were removed under reduced pressure. The crude product was purified by silica gel chromatography using hexane/ethyl acetate as eluent to afford 114 and 118.

4a-Methyl-2-phenyl-2,3,4,4a-tetrahydroindeno[1,2-b]pyran-5(9bH)-one (114a).

This compound was isolated as pale yellow oil. Following the general procedure 21, 30 mg of 95a afforded 25 mg of 114a (83% yield). $R_f = 0.6$ (Hexane/EtOAc = 4/1). IR (thin film, neat): v_{max}/cm^{-1} 3033, 2930, 2865, 1720, 1605, 1455, 1284, 1068, 760. ¹H-NMR (400 MHz, CDCl₃): δ 7.81 (d, J

= 7.6 Hz, 1H), 7.71-7.62 (m, 2H), 7.53-7.49 (m, 1H), 7.39-7.36 (m, 1H), 7.32-7.19 (m, 4H), 4.88 (s, 1H), 4.54 (dd, J = 10.3 and 3.0 Hz, 1H), 2.51 (td, J = 13.7 and 4.7 Hz, 1H), 1.92-1.70 (m, 3H), 1.14 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 208.0, 151.1, 142.5, 135.3, 134.8, 129.6, 128.3(2C), 127.4, 127.2, 125.9(2C), 124.3, 82.3, 77.7, 48.4, 30.2, 28.8, 24.8. HRMS (ESI): m/z calcd for C₁₉H₁₉O₂ (M+H)⁺: 279.1385. Found: 279.1371.

4a-Benzyl-2-phenyl-2,3,4,4a-tetrahydroindeno[1,2-b]pyran-5(9bH)-one (114b).

This compound was isolated as pale yellow oil. Following the general procedure **21**, 30 mg of **95b** afforded 24.4 mg of **114b** (81% yield). $R_f = 0.6$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3061, 3031, 2924, 2857, 1717, 1605, 1451, 1344, 1217, 1066, 756, 702. ¹H-NMR (**400 MHz, CDCl**₃): δ 7.79 (d, J = 7.6 Hz, 1H), 7.62-7.57 (m, 2H), 7.49-7.41 (m, 1H), 7.38-7.36 (m, 1H), 7.33-7.29 (m, 1H), 7.26-7.13 (m, 7H), 7.00-6.99 (m, 1H), 5.06 (s, 1H), 4.47 (dd, J = 10.3 and 2.8 Hz, 1H), 2.90 (d, $J_{AB} = 13.5$ Hz, 1H), 2.75 (d, $J_{AB} = 13.5$ Hz, 1H), 2.36 (td, J = 14.1 and 4.0 Hz, 1H), 1.98-1.52 (m, 3H). ¹³C-NMR (**100 MHz, CDCl**₃): δ 207.0, 151.2, 142.5, 136.1, 134.8, 130.2(2C), 129.6, 128.3(2C), 128.1(2C), 127.4, 126.9, 126.7, 125.8(2C), 124.9, 124.1, 80.0, 77.5, 53.0, 43.7, 30.0, 27.3. HRMS (**ESI**): m/z calcd for C₂₅H₂₃O₂ (M+H)⁺: 355.1698. Found: 355.1715.

4a-Methyl-2-(naphthalen-1-yl)-2,3,4,4a-tetrahydroindeno[1,2-b]pyran-5(9bH)-one (114c).

This compound was isolated as pale yellow oil. Following the general procedure **21**, 25 mg of **95e** afforded 20.2 mg of **114c** (81% yield). $R_f = 0.7$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3053, 2931, 2865, 1717, 1604, 1461, 1074, 777. ¹H-NMR (400 MHz, CDCl₃): δ 7.95

(d, J = 8.4 Hz, 1H), 7.90-7.79 (m, 3H), 7.73-7.62 (m, 3H), 7.54-7.49 (m, 2H), 7.46-7.42 (m, 2H), 5.28 (dd, J = 9.7 and 3.2 Hz, 1H), 5.00 (s, 1H), 2.52 (td, J = 13.9 and 4.9 Hz, 1H), 1.94-1.85 (m, 2H), 1.74-1.53 (m, 1H), 1.22 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 26.5, 151.0, 138.0, 135.4, 134.9, 133.7, 130.3, 129.7, 128.9, 127.2, 125.9, 125.5, 125.4, 124.4, 123.1, 122.9, 82.5, 74.5, 48.5, 29.1, 28.8, 24.5. HRMS (ESI): m/z calcd for C₂₃H₂₁O₂ (M+H)⁺: 329.1542. Found: 329.1531.

8-Methoxy-4a-methyl-2-phenyl-2,3,4,4a-tetrahydroindeno[1,2-b]pyran-5(9bH)-one (114d).

This compound was isolated as pale yellow oil. Following the general procedure **21**, 25 mg of **95g** afforded 21.8 mg of **114d** (87% yield). $R_f = 0.6$ (Hexane/EtOAc = 3/1). **IR** (thin film, neat): v_{max}/cm^{-1} 2934, 1709, 1601, 1489, 1455, 1337, 1067, 1022. ¹H-NMR (400 MHz, CDCl₃): δ 7.74 (d, J = 8.4 Hz, 1H), 7.40-7.38 (m, 1H), 7.33-7.20 (m, 4H), 7.13-7.12 (m, 1H), 7.03-7.00 (m, 1H), 4.82 (s, 1H), 4.55 (dd, J = 10.1 and 3.4 Hz, 1H), 3.88 (s, 3H), 2.44 (td, J = 13.8 and 5.0 Hz, 1H), 1.89-1.54 (m, 3H), 1.16

(s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 206.4, 165.3, 153.9, 142.6, 128.5, 128.3(2C), 127.5, 126.0, 125(2C), 117.3, 110.6, 82.1, 77.6, 55.7, 48.4, 30.0, 28.7, 24.8. HRMS (ESI): *m*/*z* calcd for C₂₀H₂₁O₃ (M+H)⁺: 309.1491. Found: 309.1475.

6,8-Dimethoxy-4*a*-methyl-2-phenyl-2,3,4,4*a*-tetrahydroindeno[1,2-*b*]pyran-5(9*bH*)-one (114e).

This compound was isolated as pale yellow oil. Following the general procedure **21**, 20 mg of **95j** afforded 16 mg of **114e** (80% yield). $R_f = 0.3$ (Hexane/EtOAc = 4/1). **IR (thin film, neat):** v_{max}/cm^{-1} 2934, 2852, 1706, 1604, 1459, 1327, 1215, 1060, 738. ¹H-NMR (400 MHz, CDCl₃): δ 7.39-

7.37 (m, 1H), 7.27-7.21 (m, 4H), 6.72 (d, J = 2.0 Hz, 1H), 6.44 (d, J = 2.0 Hz, 1H), 4.74 (s, 1H), 4.50 (dd, J = 10.2 and 3.1 Hz, 1H), 3.93 (s, 3H), 3.87 (s, 3H), 2.46 (td, J = 13.7 and 3.2 Hz, 1H), 1.89-1.51 (m, 3H), 1.15 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 204.0, 167.0, 159.4, 155.7, 142.7, 128.3(2C), 127.4, 126(2C), 116.7, 102.8, 99.6, 81.9, 77.7, 55.9, 55.8, 48.5, 30.2, 28.7, 25.1. HRMS (ESI): m/z calcd for C₂₁H₂₃O₄ (M+H)⁺: 339.1596. Found: 339.1580.

10*a*-Methyl-8-phenyl-8,9,10,10*a*-tetrahydrobenzo[4,5]indeno[1,2-*b*]pyran-11(6*bH*)-one (114f).

This compound was isolated as pale yellow solid. Following the general procedure **21**, 30 mg of **95k** afforded 24 mg of **114f** (80% yield). M.P = 118-120 °C. $R_f = 0.5$ (Hexane/EtOAc = 4/1). **IR** (**thin film, neat**): v_{max}/cm^{-1} 3061, 2928, 2858, 1705, 1450, 1324, 1077, 1023, 750, 699. ¹H-NMR (400

MHz, CDCl₃): δ 9.12 (dd, J = 7.8 and 0.5 Hz, 1H), 8.12 (d, J = 8.3 Hz, 1H), 7.93 (d, J = 8.0 Hz, 1H), 7.79-7.68 (m, 2H), 7.62-7.60 (m, 1H), 7.40-7.34 (m, 1H), 7.27-7.22 (m, 4H), 4.98 (s, 1H), 4.64 (dd, J = 10.0 and 2.1 Hz, 1H), 2.49 (td, J = 13.8 and 5.2 Hz, 1H), 2.01-1.56 (m, 3H), 1.26 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 208.7, 153.3, 142.8, 135.9, 134.1, 129.5, 128.9, 128.5, 128.3(2C), 127.4, 127.1, 126.0, 125.8(2C), 124.7, 124.0, 82.0, 77.6, 48.3, 30.0, 28.7, 24.7. HRMS (ESI): m/z calcd for C₂₃H₂₁O₂ (M+H)⁺: 329.1542. Found: 329.1535.

10,11-Dimethoxy-7*a*-methyl-7,7*a*-dihydrodibenzo[a,*h*]azulen-8(12*bH*)-one (118a).

This compound was isolated as white solid. Following the general procedure **21**, 25 mg of **95h** afforded 15.4 mg of **118a** (65% yield). M.P = 169-171 °C. $R_f = 0.2$ (Hexane/EtOAc = 2/1). **IR (thin film, neat):** v_{max}/cm^{-1} 2958, 1695, 1593, 1498, 1460, 1296, 1011, 756. ¹H-NMR (400 MHz, CDCl₃): δ 7.41

(dd, J = 7.2 and 1.4 Hz, 1H), 7.37-7.28 (m, 2H), 7.17 (s, 1H), 7.11 (dd, J = 7.2 and 1.4 Hz, 1H), 6.20 (dd, J = 10.4 and 1.5 Hz, 1H), 6.08 (s, 1H), 5.68-5.62 (m, 1H), 3.98 (s, 1H), 3.91 (s, 3H), 3.71 (s, 3H), 2.27 (dd, J = 12.6 and 8.0 Hz, 1H), 2.08-2.02 (m, 1H), 1.39 (s, 3H). ¹³C-NMR (100 MHz, CDCl₃): δ 208.6, 155.9, 151.1, 149.4, 139.4, 137.7, 132.1, 131.6, 130.0, 129.9, 129.2, 127.3, 126.9, 105.5, 103.3, 68.7, 57.8, 56.1, 56.0, 36.1, 23.4. HRMS (ESI): m/z calcd for C₂₁H₂₁O₃ (M+H)⁺: 321.1491. Found: 321.1482.

7*a*-Benzyl-10,11-dimethoxy-7,7*a*-dihydrodibenzo[*a*,*h*]azulen-8(12*bH*)-one (118b).

This compound was isolated as pale yellow solid. Following the general procedure **21**, 20 mg of **95i** afforded 10 mg of **118b** (52% yield). $R_f = 0.3$ (Hexane/EtOAc = 3/1). **IR (thin film, neat):** v_{max}/cm^{-1} 3022, 2926, 2849, 1693, 1593, 1498, 1293. ¹H-NMR (**400 MHz, CDCl₃**): δ 7.35-7.27 (m,

4H), 7.25 (s, 1H), 7.24-7.23 (m, 3H), 7.14 (s, 1H), 7.10-7.08 (m, 1H), 6.17 (dd, J = 10.4 and 1.5 Hz, 1H), 5.94 (s, 1H), 5.68-5.61 (m, 1H), 4.16 (s, 1H), 3.89 (s, 3H), 3.63 (s, 3H), 3.40 (d, J = 13.7 Hz, 1H), 2.89 (d, J = 13.7 Hz, 1H), 2.40 (dd, J = 12.4 and 8.0 Hz, 1H), 2.17-2.12 (m, 1H). ¹³C-NMR (100 MHz, CDCl₃): δ 207.8, 155.9, 152.1, 149.2, 139.5, 138.0, 137.9, 132.1, 131.8, 130.4(2C), 130.4, 130.0, 128.8, 128.3(2C), 127.3, 126.9, 126.4, 105.5, 103.1, 74.0, 56.1, 56.0, 51.9, 42.4, 36.3. HRMS (ESI): m/z calcd for C₂₇H₂₅O₃ (M+H)⁺: 397.1804. Found: 397.1806.

General Procedure 22: Derivatization of pyran 114a

An oven dried 5 mL glass vial was charged with pyran **114a** (30 mg, 0.1 mmol) in methanol solvent (1.0 mL) and *p*-tosylhydrazide was introduced under nitrogen atmosphere and stirring continued at 60 $^{\circ}$ C until **114a** disappeared as monitored by TLC. Methanol was removed under reduced pressure. The crude product was purified by silica gel chromatography using hexane/ethyl acetate as eluent, to afford **115** as colourless solid. The hydrazone **115** was

recrystallized using ethanol/hexane mixture at room temperature and its structure was confirmed by X-ray diffraction analysis.

4-Methyl-N'-(4*a*-methyl-2-phenyl-2,3,4,4*a*-tetrahydroindeno[1,2-*b*]pyran-5(9*bH*)ylidene)benzenesulfonohydrazide (115).

"Phosphine- and water-promoted pentannulative aldol reaction"
 <u>Satpathi, B.</u>; Dutta, L.; Ramasastry, S. S. V. Org. Biomol. Chem. 2019, 17, 1547.

(2) "Metal- and Hydride-Free Pentannulative Reductive Aldol Reaction" Satpathi, B.; Dutta, L.; Ramasastry, S. S. V. Org. Lett. **2019**, *21*, 170.

(3) "Recent metal-catalysed approaches for the synthesis of cyclopenta[b]indoles"
 Vivekanand, T.; Satpathi, B.; Bankar, S. K.; Ramasastry, S. S. V. RSC Adv. 2018, 8, 18576.
 [Invited for the RSC Advances special issue celebrating the decennial year of Chemical Frontiers Goa]

 (4) "Orgαnocαtalytic Strategies for the Synthesis of Cyclopenta-Fused Arenes and Heteroarenes"

Satpathi, B.; Mondal, A.; Ramasastry, S. S. V. Chem. – Asian. J. 2018, 13, 1642. ['Focus Review' invited by the Editor]

(5) "A computational investigation of the solvent-dependent enantioselective intramolecular Morita-Baylis-Hillman Reaction of enones"
Singh, N. K.; <u>Satpathi, B.</u>; Balanarayan, P.; Ramasastry, S. S. V. Org. Biomol. Chem. 2017, 15, 10212. [Invited for the themed issue 'Mechanistic Aspects of Organic Synthesis']

(6) "Enantioselective organocatalytic intramolecular Morita-Baylis-Hillman (IMBH) reaction of dienones, and elaboration of the IMBH adducts to fluorenones"
 <u>Satpathi, B.</u>; Wagulde, S. V.; Ramasastry, S. S. V. Chem. Commun. 2017, 53, 8042.

 (7) "Enantioselective Organocatalytic Intramolecular Morita-Baylis-Hillman Reaction of Some Unusual Substrates"

Satpathi, B.; Ramasastry, S. S. V. Synlett 2016, 27, 2178. [Invited 'Synpacts' article]

(8) "Morita-Baylis-Hillman Reaction of β,β-Disubstituted Enones: An Enantioselective Organocatalytic Approach for the Synthesis of Cyclopenta[b]annulated Arenes and Heteroarenes"

Satpathi, B.; Ramasastry, S. S. V. Angew. Chem., Int. Ed. 2016, 55, 1777.

- First Morita-Baylis-Hillman reaction of the β , β -disubstituted- α , β -unsaturated ketones.

- Efficient access to cyclopenta[b]annulated thiophenes, indanones and pyrindanones.

- Excellent substrate scpe and short reaction times; yields up to 97% and ee up to >99%.
- (9) "Synthesis of 1,2,3-Trisubstituted Cyclopentannulated Benzothiophenes through an Acid-Mediated, Solvent-Free, One-Pot Domino Process"
 <u>Satpathi, B.; Dhiman, S.; Ramasastry, S. S. V. Eur. J. Org. Chem.</u> 2014, 2022.

The author, Mr. Bishnupada Satpathi was born at Egra, West Bengal. After his initial schooling at Egra, he received a B.Sc. degree in Chemistry from Bajkul Milani Mahavidyalaya, Vidyasagar University in 2011. After obtaining a Masters degree from the Indian Institute of Technology (IIT), Hyderabad, in 2013, he joined the research group of Dr. Ramasastry at the Indian Institute of Science Education and Research (IISER) Mohali, as a Ph.D. student in January 2014. He passed the comprehensive examination in January 2015. Presently, he is working as a Senior Research Fellow of IISER Mohali in the Department of Chemical Sciences.

CONFERENCES ATTENDED

- Delivered a talk at the Emerging Trends in Drug Developments and Natural Products (ETDDNP-2018) held at University of Delhi, India during January 2018 and received Elsevier award for one of the best oral presentations. Title of the presentation: *Organocatalytic Enantioselective Cyclopentannulation of Arenes and Heteroarenes.*
- Presented a poster at the **Thematic Conference in Chemical Sciences (TC₂S-2017)** held at IIT-Ropar, India during May 2017 and awarded for one of the best poster presentations. Title of the poster: *Cyclopentannulation of Arenes and Heteroarenes*.
- Presented a poster at the **International Conference on Organic Synthesis (ICOS 21)** held at IIT-Bombay, India during December 2016. Title of the poster: *Cyclopentannulation of Arenes and Heteroarenes.*
- Delivered a talk at the XI JNOST-Organic Chemistry Conference (JNOST-OCC) held at NISER-Bhubaneswar, India during December 2015. Title of the presentation: *Unusual Approaches for Cyclopentannulation of Arenes and Heteroarenes.*
